Oh there may have a been a couple over the years...but the
prospect of going to the infantry instead of some warm radio
room was all the incentive most everyone needed...

Can you think of any OTHER reason why they would have done
so?
Quick, get that super IQ to work and thinkup some catchy
answer.

Meanwhile the rest can read a report from a EA ham:

This is the experience from Spain. Here in EA-land
we had the CW reading tests optional for the HF bands during
the 80's and, as
those of you who were active on the bands by then could
testify, the spanish
phone ops were internationally regarded as "lids". The ranks
were flooded with
CBers looking for more room and their jargon has still firm
influence in the ham
phone language. Most of them bought expensive antennas and
japanese blackboxes
but got bored in a few years and are not active anymore.

Yeah, I know-all politics is local and in ham radio all
"evidence" is anectodal. "Proof" just doesn't exist, does
it? Unless, of course you want to query the Spanish
telecommunications authority to see why they would do such a
Luddite act as reinstituting mandatory Morse code tests for
their ham radio operators....

>

So what makes you think this restructuring saves a single
hz of ham radio spectrum? When the commercial demand rises
to a certain level, any ham radio UHF/VHF/SHF spectrum not
committed to ham radio via international treaty WILL be
withdrawn and refarmed. Bet on it. And even that allotted to
hams under international treaty can be reallocated if need
is such that FCC decided to take an exception to the treaty

So if you believe that this change solves anything, time to
rethink the whole situation. No realistically conceivable
added numbers of new hams will help.

Oh Please! You knew how to find this newsgroup. And you were confident enough to post an inflamatory article.

That's why the other individual referred to you as a Troll. And that's why nobody has answered your question about the term's meaning.

>> >
>> >As I recall, a few years back there was actually rumors of the FCC
>> >giving freebanders their own legal band between 27.405 and 28.000.

There has been nothing in print to this effect. Your purpose in saying this is uncertain. It does not fit with the remainder of the post.

>> >Perhaps this is an intended effort by the FCC to give 11m operators (who
>> >
>> >are also no-code-Techs) a quasi-legal place to operate up at 28.3-.5?
>> >

First of all, there is no such thing as "quasi-legal" operating in the Amateur bands. It's like being pregnant; you IS or you ISN'T!

Second, what do you mean by referring to "11m operators (who are also no-code-Techs)? Not all 11m operators are no-code-Techs. If you mean that SOME of them are no-code-techs, why mix in the reference to 11m? Everybody knows that there are American citizens who enjoy operating CB but who also have a ham ticket. Do not confuse the two, nor try to link them. When a ham operator operates on 11 meters, he "checks his ham license at the door." He is a citizen, like everyone else. Period. End of story.

Or, reversing things: a no-code Tech is an Amateur with specific operating rules. CB has no bearing on what he does on 10 meters.

>I am an amatuer operator myself, but I can't figure out why some other
>hams felt the need to clutter this "CB" newsgroup with information on
>amatuer radio.

With very few exceptions (and I do mean VERY FEW), comments concerning Amateur radio are originated by non-hams, usually in the form of a snide remark or outright verbal attack, and often include misleading information. Your post is an excellent example of a post which has started yet another ham thread in the CB newsgroup--which is your specific complaint!

This NG is read by numerous Amatuers and naturally they will respond when attacked or to correct errors. For example, see the recent thread which developed when a CBer (or troll, we don't know for sure) posted statements that the Columbia Monitoring Station was closed and that the FCC was out of money. Numerous persons responded with the truth.

> We've got all these amatuer bands to operate on, and yet we
>still want to try and regulate what 11 meter operators do.

Excuse me, but that is not true. CB is almost never heard being discussed on the ham bands, nor do you see references to CB in Amateur publications. And I assure you that any ham operator who jumps into this NG and attempts to start "preaching" to CBers will be soundly denounced by CBers and Ham participants, alike.

This principle is specifically addressed in the FAQ for this NG. It's probably time for a repost.

The whinney cry-babies will continue to whine and cry as long as there
are any requirements to obtaining an amateur radio operators license
until the only requirement is to simply go purchase a rig and get on the
air, just like cb.

The ARRL, though caught off guard with the FCC proposal made several
counterproposals... all published in QST...

>I'm sorry, I have not heard this issue discussed.

Obviously, you're not an ARRL member or you would have heard in QST
(assuming you READ it) It was in ALL the HAM mags... I trust you don't
expect the ARRL to knock on your door to inform you of pending FCC
changes....

>Really now, how difficult is it to use the any of the blocks of letter
call prefixes... that's a >simply administrative duty for the FCC to
implement...

I think they'd just as soon not be bothered with Hams at all... when's the
last time the FCC got anything out of your pocket, fee-wise? (be fair now...
amateur related expenses only, don't include vanity calls)

That's BS, pure and simple... when the 10m band is open, 28.3-28.5 is the most crowded sub-band on the Amateur freqs (a fovorite of DX'ers). When band is NOT open, it is dead because several of the other ham bands offer far better local communications (by local, I mean 5 -1500 miles)

I think this post is bogus, but if it isn't.....
Reading power output on a Radio Shack meter, that's about all you're going to see.
These amps will do 200 and then some, especially on SSB.

Greetings!

The bumper mount may be the culprit. Take a cheapie mag mount antenna
and put it up on the roof, and note the noise.

I should still be there, only a lot less.

If it's a lot less, then the Fuel pump is the culprit.

Alternator whine varies, ot changes tone, with engine speed and is
more noticeable when the battery is weak, or the headlights are on.

Newsline 1168

Newsline report number 1168 for release on Friday, December 31 st., 1999 to follow in

5-4-3-2-1.

The following is a Q-S-T. An end of the century surprise from the F-C-C. The year 2000 will be the year of restructuring the United States Amateur Radio Service. Find out the details on the final Newsline report of the
20th century coming your way right now!

(Billboard Cart Here)

**

RESTRUCTURING OF HAM RADIO IS HERE

The F-C-C has made good on its promise and has released the long awaited Report and Order on restructuring the face of ham radio in the United States. It's a document that is filled with surprises as we hear from Newslin
es Paul Courson WA3VJB in the nations capital:

--

Traditionalists may fret that the code test for the Extra Class license will be only 5 words-per-minute, and that the Novice, General, and Advanced Class licenses will NO LONGER be available to newcomers.

The NO CODE license will continue and be called the Technician Class, allowing operation only above 30 megahertz.

The FCC believes the changes, announced in the final hours before the agency broke for the New Year's holiday, will streamline and revitalize the structure of the Amateur service. They take effect April 15th.

The Commission's executive summary highlights the changes like this:

• Only three types of license from the present six.
• Only a single, 5 wpm code test for the new General and Extra Class license.
• Only a three-part range of written tests for licensing, instead of five possible elements under the current system.

Newly licensed hams will have available to them a Technician, a General, and an Extra Class license. Most existing licensees retain the

option of renewing and keeping the name and operating authority of a present-day clas
s, such as Advanced, and Novice. The Tech-Plus license will renew as Technician with existing privileges on HF.

Incoming Technician licensees face a 35-question test element, and a candidate for General will have to pass that test PLUS an additional 35-questions, and the 5 wpm code test.

The Extra Class license will require a written test of 50 questions plus the two sets of 35 just mentioned, along with the 5 wpm code test.

It's been ten years since the last major overhaul of regulations governing the Amateur Radio Service. The FCC said the latest restructuring takes technological change into account, as well as operating trends which have
minimized the prominence of Morse code.

And while the Novice class license won't be issued anymore, except for renewals, the Commission said the comments received did NOT provide a clear concensus on what to do with the protected band segments on HF, now set as
ide for Novice CW use. Instead, the agency said it will wait and see whether rising technology could qualify for those protected sub-bands, license class notwithstanding.

The Commission deliberated the code controversy as presented among the 22-hundred comments filed in response to the Notice of Proposed Rulemaking after it came out more than a year ago.

The FCC concluded that the more stringent CW requirements did not serve any regulatory purpose, nor did the faster speeds prove someone could advance the art of radio as defined as a purpose for the Amateur Service.

The agency relied on the old international treaty justification to explain why it must preserve a code requirement. The 5 wpm test, the Commission said, meets that international standard for operations below 30 megahertz
Moreover, the FCC said it would NOT "sunset" the remaining 5 wpm test should future treaties abandon the requirement. The Commission suggested it'll deal with that issue when and if the time comes.

The Amateur community is already "dealing with" the prospect of relaxed licensing requirements. A quick sample of comments on 40 meters phone found most people concerned about the watered-down code requirement more than a
ny other issue in the restructuring:

From Dave, W3NP:

I have no problem with them lowering the speed requirement.... for the higher class licenses... if they can demonstrate that the written

portion will guarantee at least reasonably, that the applicant is technically compet
ent.

From Mike, WN3B:

Ah, there is no CW requirement -- 5 wpm -- that's uh, we're certainly reducing our standards, the way I see it.

And from Carol, W4CLM:

It's not so much an ancient art, such as CW having been watered-down, as it's more a matter of a continued dumbing-down of America. Give me something for nothing type of attitude.

The FCC said it hopes the rules change will allow currently-licensed hams to do more to advance the art of radio, along with eliminating some obsolete requirements which may discourage people from joining the hobby.

The agency also hopes to reduce how much it costs to regulate the Amateur Service, while promoting what it calls efficient use of allocated spectrum.

Other changes in the restructuring include phasing out separate station licenses for RACES, the Radio Amateur Civil Emergency Service, dating back to 1952. It was established as a temporary communications system for civil
defense. The licenses won't be renewed, but the FCC anticipates emergency communications will continue as they have been doing under club, military and individual station calls.

Among changes for the Volunteer Exam Program, existing Advanced-class licensees will be able to prepare and administer tests for prospective General Class operators. The FCC is also giving more power to Volunteer Examiner
s to design and carry out the testing of prospective hams.

Newsline's comprehensive coverage of the Restructuring of Amateur Radio continues, in a moment.

In Washington, I'm Paul Courson, WA3VJB reporting for Newsline.

--

What about the impact of restructuring on the ham-in-the street? What will it mean to him or her. For an analysys, we go to CQ Magazine editor Rich Moseson, W2VU:

--

The immediate impact of the FCC's restructuring decision, in my view, is that our hard-working Volunteer Examiners had better get ready for a crush of applicants before April 15th -- especially those with Tech-Plus and Ad

vanced Class licenses -- who want to pass written Elements 3B or 4B, respectively, and qualify for instant upgrades to General or Extra after the new system kicks in. This is because the FCC will recognize credit for all
exam elements already passed, and waiting until after Tax Day to take the upgrade exam means Techs and Advanced hams will have to be retested on material they've already passed in Elements 3A and 4A. Getting credit for th
ose written "B" elements ahead of time means they'll have everything they need to qualify for an upgrade after April 15th.

Here's an important note: there will be no automatic upgrades. Even if you already have all the element credit you need to upgrade, you will still need to come to a VE session, show the examiners proof of all that element
credit and fill out a Form 605. And yes, you'll have to pay the six dollars and 65 cents.

Why the extra paperwork? It's simple -- the FCC won't take on any new responsibility that's going to cost it money or add to its workload. By transferring the paperwork responsibility to the licensee and the VEs, the appl
ications are processed through the electronic system already in place and cost the Commission zero in terms of dollars or hours.

Overall, this decision should reverse the trends we've seen in recent years of declining numbers in the middle license classes. Removing the barriers of 13- and 20-word-per-minute code exams should prompt many hams to dus
t off their study guides, although it might be best to buy one that's up-to-date. Our advice in the February issue of CQ: No matter what license class you have, besides Extra, get studying, and have as much element credit
as you can in hand before April 15th.

--

This is only the beginning of the restructuring story. Obviously, not everyone will be happy and requests for reconsideration on several parts are inevitable. The complete text of this Report and Order is available for
downloading at our website. That's at w-w-w dot a r newsline dot o-r-g. More on restructuring, next week. (Newsline)

Initial Reaction to Restructuring

(David Black KB4KCH Report Here) (Newsline)

**

VENEZUELAN HAMS ACTIVATE IN FLOODING DISASTER

Turning to other news, ham radio is still providing important emergency communications in the wake of mudslides that killed thousands in Venezuela. Rick Lindquist of the A-Double-R-L Audio News says that radio amateurs w
ere called up because they could do what no other service could:

Word from Venezuela is that hams activated early on during the flooding and mud slide disaster that struck that country's Caribbean coast December 16.

"The emergency is by all means the major disaster that ever happened in Venezuela in modern times, and there is an ongoing need for further communication support," said Pedro Seidemann, YV5BPG.

Seidemann says Radio Club Venezolano club station YV5AJ and national emergency net station YV5RNE are on the air on the official emergency frequency 7090 kHz as well as on local 2-meter repeaters and monitoring 146.580 si
mplex.

Initial flooding following several days of sustained rainfall was exacerbated by mud slides resulting from overflowing creeks coming down from the Avila mountain range. "Mud slides, some high in the mountains, were the ma
jor cause of the disaster in this part of the country," Seidemann said, noting that the sustained rains are considered "rather unusual" in that part of the world.

Officials say the death toll in the flooding and subsequent mud slides could go as high as 20,000. Seidemann said countless people are still unaccounted for, and--especially in the seacoast area near Caracas--many bodies
have been buried by thick mud.

"Venezuelan Civil Defense organization and Conatel--the national telecommunication administration--and the Red Cross have asked RCV for its urgent ongoing support in the seacoast townships near Caracas," Seidemann said th
is week. Hard hit are the Barlovento area east of Caracas and the Falcon State in northwestern Venezuela. "There, local radio communications have collapsed, and highways are cut. Large areas are without electricity." Seid
emann said the power outages also are affecting telephone service.

Seidemann says RCV is focusing its communications support toward these two disaster areas, where flood survivors remain in isolated regions.

Just before the disaster, RCV had tested its facilities on HF and VHF to check for Y2K compliance. As a result, Seidemann says, RCV already was in a state of readiness when the disaster struck. RCV has acknowledged the co
operation on 40 meters of foreign stations in avoiding the Venezuelan Emergency Net frequency.

Seidemann indicated a need for additional Amateur Radio gear in Venezuela.

MORE TO MANY CLUB CALL SIGNS

The F-C-C has asked a Los Angeles California ham why he needs twelve call signs and has told him that he must justify each one. In a letter to Joel Pastor, W-J-1-P, the regulatory agency asks for that he must provide a l
ist of the names, addresses and telephone numbers of the members, meeting times and dates within the past year for each club. It also asks him for information on proposed meeting times and locations within the coming ye
ar, and copies of minutes, if any, taken at meetings within the past three months for each club. He is also requested to list any other call signs licensed in his name that are not shown in the F-C-C letter. The F-C-C s
ays that Pastor claims club call signs in several geographic locations including Southern California, Northern California, Nevada, Texas and New Jersey. (FCC)

**

SOUTH HILLS ARC CALL SIGN SETTLED

The F-C-C has settled a dispute between to people claiming ownership of the N-3-S-H South Hills Amateur Radio Club call sign. Back in March of 1999 the F-C-C had written to Ronald Lentz, N-3-W-X, of Pittsburg Pennsylvani

a regarding a complaint filed by the N-3-S-H Amateur Radio Club. This, concerning allegations of an unauthorized transfer of a call sign. The F-C-C says that Lentz did not respond to that letter, and the call sign N-3-S
-H was re-assigned to that group, which was then named Wireless Association of South Hills, Inc.

But the story does not end there. According to the F-C-C's Riley Hollingsworth, records show that Lentz again applied for N-3-S-H in the name of the South Hills Amateur Radio Club, Inc. and that application was granted
in error on July 15, 1999.

Hollingsworth says that the Commission may, upon learning that an application has been granted as a result of an inadvertent, ministerial processing error, set aside the erroneous grant. Therefore it is canceling the N-3
-S-H call sign away from Lentz and assigning his previous call sign, K-B-3-B-R-F to South Hills Amateur radio Club, Inc., and re-assigning N-3-S-H to the Wireless Association of South Hills, Inc.

Hollingsworth has also advised Lentz that any future attempt to obtain this call sign, N-3-S-H, without a full disclosure and justification of the circumstances on his application will be considered an abuse of the Commis
sion's processes. This says Hollingsworth will reflect adversely on Lentz qualifications to retain his N-3-W-X Amateur license. (FCC)

**

40 Meter Warning Notice

Still with enforcement news, the F-C-C has sent a warning notice to a Capo Beach California ham that notifies him to stop his alleged transmitting of music on the 40 meter band. In tits November 30th letter to Dave L. F
lanagan, W-A-6-F-C-W, the regulatory agency again cites monitoring information alleging that he or someone operating his station transmitted music on 7 point 258 MHz that interfered with ongoing amateur communications on
that frequency. The FCC said the interference had occurred over the previous month. It warned W-A-6-F-C-W additional incidents could result in a fine, license revocation proceedings, and seizure of his ham radio station
gear. (FCC)

KENWOOD ASKS FCC TO RULE ON "SKY COMMAND" SYSTEM

Kenwood Communications Corporation has asked the FCC either to declare that its "Sky Command" remote control system complies with Commission rules or to waive applicable sections of the regulations to make it legal.

The "Sky Command" system, which Kenwood has been marketing for about two years, lets the user control a fixed high frequency station using a pair of dual-band transceivers. Sky Command operates in full duplex, using a 7
0-cm frequency to transmit audio and control commands to a dualband transceiver at the remote station and a 2-meter frequency to transmit received audio via the remote station's SkyCommand transceiver to the operator's tr
ansceiver. Sky Command's V-H-F link does include a Morse code I-D.

The ARRL has declined to permit Kenwood to advertise its "Sky Command" system in its Q-S-T magazine. The A-R-R-L maintains that the system is not legal to use as it's configured because the use of a 2-meter frequency wou
ld cause amateurs using the system to violate Section 97.201(b) of the Amateur Service Rules. This section limits auxiliary operation to certain frequencies above 222.15 MHz.

The Kenwood request has been assigned as D A 99 dash 2805. Comments are due by January 31st with reply comments no later than February 14th. (ARRL)

TV: 8VSB vs. COFDM

As we head into the 21st century a major disagreement in the world of digital t-v could eventually impact on the way that even amateur television enthusiasts operate. Newsline's Jim Dameron, N-8-T-M-W has more:

--
Bob Gonsett's C-G-C Communicator notes two stories concerning the introduction of digital television in the United States that will be of interest to fast scan Amateur Television enthusiasts.

They come from the publication Tech Notes and the first of these involves a report that the Department of Defense has reportedly raised concerns about the 8-V-S-B system as it is currently implemented. This is because th
e D-O-D says that 8-V-S-B requires outdoor antennas which are vulnerable in natural and other disasters. The article says that 8-VSB has trouble reaching indoor antennas and the D-O-D reasons that the 8-V-S-B transmissi

on system will limit the government's ability to communicate with its citizens.

The second item is a letter from Mark E. Hyman, who is the Vice President of Corporate Relations for Sinclair Broadcast Group. Hyman writes urging other broadcasters who are as of this time uncertain of their position re
garding 8-V-S-B verses the European C-O-F-D-M system to write the F-C-C and ask that it open a public commentary period on the matter.

Hyman's complete letter is available on the web at http://216.24.35.148/cgc/. Click on Additional Postings then click on 'SUPPORT THE COFDM VS. 8-VSB DEBATE.

--

As we go to air, one of the broadcast trade journals is reporting that numerous broadcasters have signed a Sinclair Broadcast Group petition asking the F-C-C to re-open the 8-V-S-B verses C-O-F-D-M issue. (CGC Communicat
or, BRT)

Burrowing Owl Search Area Increases

Its barely 2000 but Joe Moell, K0OV, says that more volunteers in southern United States are needed for the Burrowing Owl Project radio tracking project.

According to Joe, forty-eight owls wearing miniature radio transmitters left Saskatchean and Alberta last fall. Where are they now? Probably in southern states somewhere between California's Imperial Valley and the east
coast of Texas. Some might be in northern Mexico but no one really knows for sure. That's where hams and other monitoring enthusiasts come in.

If you have a sensitive receiver, scanner, or wide-range handi-talkie that tunes from 172 to 173 MHz you can help. If you have radio direction finding gear for that frequency range, so much the better.

For more information, see the Burrowing Owl page of Joe's "Homing In" Web Site. Thats where you will find a list of the 33 still-active bio-tag frequencies and information about suitable equipment for monitoring at 172 M
Hz. Most important of all, there's information on what to do if you receive a tag signal.

The "Homing In" URL is is simple to remember. Its www dot homingin dot com (K0OV)

**

P3D Past Y2K

The year 2000 should see the long awaited launch of the Phase 3 D ham radio satellite. So says AMSAT North America President Keith Baker, K-B-1-S-F.

In an article on the AMSAT B-B-S, Baker says things are looking good for a lunch of the Phase 3-D ham radio satellite during the next twelve months. According to Baker, the bird is still in Orlando where the satellite te
am has been busy getting the last-minute paperwork clearances and shipping details in order. This so that the satellite can be transported to the launch site at Kourou in French Guiana.

Baker says that AMSAT is waiting on various government agencies to issue the final, updated versions of the paperwork and clearance documents. Once all are in place, the shipping contractor will the spacecraft and severa
l pieces of associated ground equipment for transport to the Kourou French Guiana E-S-A launch facility. As previously reported, a launch contract accepting Phase 3D as a payload for the first suitable Arianespace Ariane
5 vehicle launch was signed last October 5th. (AMSAT-BBS)

**

Houston AMSAT Net Move Reminder

Also, Bruce Paige, K-K-5-D-O reminds us that the Houston AMSAT net moves to its new satellite home effective January 4th. If you have a home C-cand satellite system with a full size dish you can find the net on T-V-R-O N
et on the G-E Americom Spacenet 4 bird. The net will air on Transponder 6 Horizontal using a 5.8 wideband audio subcarrier. The net originates on the 147.10MHz FM repeater in Houston, Texas and is carried by many repeat
ers throughout the country. (KK5DO)

**

DX

In D-X, the Amateur Radio society of New Caledonia, has announced an Islands on the Air Dx-pedition that may activate a new D-X-C-C entity. The location is the Chesterfield Islands with a team headed by Eric Esposito, F-
K-8-G-M. Look for the part one of the operation to commence on March 15th. Pending action on the society's application to the I-A-R-U for membership, the second phase may turn out to be the initial operation from a new D
-X-C-C country. This is slated for March 23rd. This DXpedition is sponsored by Yaesu and supported by the Radio Society of Great Britain's Islands on the Air management team. (OPDX)

And a lot higher in frequency, the newly formed Roadrunners Microwave Group in Texas has announced plans for its first cumulative contest for all bands above 220 MHz . Called the Year 2000 event, it begins on begins Janu
ary 1st and ends next December 31st. The object of the contest is to promote greater day-to -day use of the higher amateur frequencies. For complete rules, scoring sheets, multiplier sheet and the like, send a self addr
essed stamped envelope to the Roadrunners Microwave Group, Post Office Box 9-3-1-7-5 Austin, Texas 7-8-7-0-9 dash 3-1-7-5 (Roadrunners)

**

Year 2000 On The Air Events

And finally a look at how hams around the world will be ringing in the year 2000 with on the air operating events. Some of these will last a month or more. Q-News Graham Kemp, V-K-4-B-B has the list and a lesson on the
word &#65533;millenium:&#65533;

Special events for Y2K. Interesting to note how correct John Aarsse VK4QA was at the start of 1999 in his column 73 on QNEWS. You'll recall how John pushed the fact that the new millenium did NOT start until January 2001
and it would be just a publicity and money making event in 2000 then we'd do it all again in 2001.

Yep over the past 5 weeks or so only 1 mention of the millenium for special events... rest are correct in celebrating the start of the 21st Century... as we've said... stay tuned for NEXT year!

Y21TA --The husband and wife team of TA3J and TA3YJ is operating until the
21st of January 2000 at 2121 UTC as YM21TA, a special event station to

celebrate the dawn of the twenty-first century. QSL is direct to TA3YJ or via the bureau.

MOLDOVA, ER. Special Event station ER2000A is active until January 20 to celebrate the new century. Please QSL via ER1DA.

HONG KONG, VR2. The Hong Kong Amateur Radio DX Association will sign VR2K until January 31 on all HF bands. QSL via VR2XRW.

ZL2OOO The month of January 2000 will be the last year and the close off date for applications will be June 30th, 2000. A reminder to anyone who has worked ZL2000 these past years and have forgotten to apply, can still d
o so, and remember..... only ONE contact with a ZL2OOO station please.

The cost of the Award is $5.00 Aust, and $10.US for overseas stations outside the Pacific Basin. No Stamps! No IRC's unless making an enquiry about the Award, and then ONLY 1 IRC please. Don't pay postage for

someone else
!!)And no money orders that are not payable outside of your country.
ZL2OOO Stations can be found on most HF Bands in January, phone and CW.
Contact on Packet: ZL2RIC @ ZL2AA.#38.NZL.OC or preferably e-mail to
ricol@xtra.co.nz

>From Q-News Australia, I&#65533;m Graham Kemp, VK4BB, for Newsline

---

Thanks Graham. And a happy and prosperous 2000 to you and your staff
at Q-News. (Q-News)

Darrell,

Basically a sound idea but it runs counter to a really basic thread
that perminates the entire rulemaking - the FCC wants to make it as
easy as possible for them to administer ham radio. Your proposal runs
counter to that.

Now, I'll add my $0.02 to the whole discussion. I first got
interested in ham radio in 1958 at the age of 9 - got my first license
(Novice) in 1963; became a General in 1965. Built my own first rig
(transmitter was crystal controlled 6J6 oscillator and an 807 final,
receiver was a Knight-Kit regen receiver, later traded in for a
Hallicrafters SX-25, which I sure wish I had of kept). Had some good
times as a ham - even met my second wife via ham radio.

However, I lost interest in ham radio in the early 80s when I got
into computers and let my license lapse in 1983. Sold my last HF rig
(an SB-104A with all the goodies) in 1985 but still have, in the back
closet, my old 2 meter rig (a Motorola Metrum with the PLL exciter
board conversion kit). I've seen a lot of changes in ham radio, and I
think that, all in all, this R&O will be good for the hobby.

Regarding the code test, remember back in the old days when the code
test was one minute error free copying AND you also had to send one
minute error-free (AND you had to use a straight key - no "bugs" or
keyers)? We sure have come a long way to the multiple-guess code test
and no sending requirement! To many people the code requirement is a
real emotional issue - I'll admit it was for me for years. I'll go
along with the reduced speed requirement, though I wish they would
reinstate the direct copy instead of the multiple-guess.

To me, the more important aspect of ham radio is the technical knowlede of communications and how to apply that knowledge. To that end I'd like to see the tests upgraded with a closed question pool. Another poster mentioned that the tests are about a generation behind current thehnology - that should be rectified. The max. grid current on a 6146 was valid in 1970; far less so in 2000. Some basics are timeless, such as basic electron theory and antenna basics, also basic operating procedures. From my listening to the HF bands lately, that last item is in DIRE need of attention!

A friend of mine from Germany has gotten my interest in ham radio restarted, and I was planning to go up for a General sometime in early February - maybe now I'll hold off until April and go for the Extra on the first shot (lordie, in 1963 the Extra was like a shining light on a very far away hill for me).

I never thought I'd hear myself say this, since in the past I've always come down on the side of "quality VS quantity", but the bottom line is that what is going to save ham radio from the "spectrum vultures" like the HF broadcasters and another UPS with a hair-brained scheme is NUMBERS - that is what the politicians at the FCC respond to. The more of us there are, the harder it is for them to screw us (more hams=more hams that VOTE). Thanks goodness we do have a few hams in the FCC that can be a voice, but it still comes down to numbers. Something else that would help is to get more hams elected to office - many of you know what a champion Barry Goldwater (K7UGA) was of ham radio during his years in the Senate. We don't have a ham of his stature in national office presently.

Well, I've consumed more than my fair share of bandwidth, so I'll close with the following thought - - -

Look at this situation keeping in mind how the world IS, not how we'd like it to be. We have to deal in REALITY and in the present, not in the past.

Regards,
Bill Bowen

I still believe that emergency services are what hams
will be able to provide that the commercial world cannot and
will not. The local 911 system is very fragile, and highly
political too. Given any kind of problem, it would be gone
in a flash.

My wife, as a public health nurse, went down to Tarboro,
NC after Princeille flooded out. The state had NO way for
their employees to communicate back home except through

whatever commercial phone service they could get. The
nurses were not told where they were going, where they would
be staying, or even when they would come back. After they
got dropped off it was up to them to try to notify their
family where they were....if they could. As one person told
me, they don't know where they are going and when they get
there there are no communications.
Here is where ham radio could make a big difference, at
least in theory. Volunteers could emerge from their homes
with their transmitters and help out a lot in such
circumstances. Cell phones were useless for 1 week after
the flooding....overloaded and/or shut down. Only about 8
days after the disaster did AT&T bring in a large dish and
establish free phone service for the 2,300 living in a high
school gym with no cash or access to money. Then my wife
could phone home, but only for 3 minutes incidently.
However, locally I guess the hams are under contract to
provide for backup for 911, not to relieve suffering of
people who cannot found their spouses for 8 days after a
disaster, and had to assume they were dead while everyone
told them, "Maybe they are in another shelter."

Why does everyone believe that there is a "super" mod for the Texas stars? The amplifier is generally well designed from the factory for the most part up to the 400, the 500, if driven needs some power wire upgrades amongst other things, but the other things I am referring to are really not to be attempted by someone who needs to ask the question of how to mod a texas star in the first place, as far as the smaller amps (up to the 350) are concerned I personally would get rid of the fuse that comes with the amp, it will only do you good in a reverse polarity situation. If the amp ever draws enough current to pop the fuse Then there is a good chance the parts inside do not need to be saved anyway, and the fuse is a very week link in these smaller amps, usually melting or corroding or both. Leave the amp the way it is, because there is a good chance that it is as clean and stable as you are going to get it, just because you see more watts on a dosy meter does not always make it better.

>Someone else made a smart remark
> about waiting another year until the millennium.

It was a smart remark because they were thinking smart. The new millennium doesn't start until Jan 1, 2001. There is no debating that. The media-driven lemming-followed hype notwithstanding.

> I think I can properly come
> to the conclusion that this year has been the most widely accepted year as
> "The New Millenium"

Sorry, but no you can't. Just because it's "accepted" doesn't make it correct. Rolling through stop signs and speeding and listening to cell calls on a scanner is accepted - but it's still against the law (or at least FCC rules). You need to know the difference between what's accepted as popular belief and what is actually fact (via hard math in this case). There are two Millennium "beginnings" - one is incorrect and media-driven, the other is the actual yet not so popular date of 2001. No surprise. People hate that extra 1 digit.

>according to the masses and news media.

Oh yeah, I'd follow the masses over the cliff, and believe the news media telling me it's a great idea. If I went along with the masses and news media on everything, I'd be wearing beige Dockers, driving a white Taurus, and eating McDonalds regularly just to get the toy.

Who you gonna believe, true facts or all the hype? You can think like an odometer or you can think rationally.

> I suppose there
> will be a FEW people out there saying "Happy New Millennium" next year
only
> to be scoffed at and made fun of. HAHA.

Truth and fact are very often scoffed at. That's why people find it so disturbing. The laughter we hear is nervous laughter. I think it's funny. But there will be more than just a few people saying Happy Millennium. And in fact, I believe the media will wise up about 3/4 of the way through 2000, for no other reason than to have one more thing to jump on to hype-up. I predicdt that the big deal in the waning months of 2000 will be all kinds of talk - all over again - about the beginning of the "real" millennium. Perhaps not with the Blast-o-Hype we had for the 2000 rollover, but it will be made very evident by the ever-eager-for-hype media. The masses as usual will go along, and this time it will be for the correct reason. In any

case, what a great way to have millennium parties two years in a row - true fact or otherwise. I'll go along with the masses on THAT one.

>Heck, I personally believe its
> really 2006

Whatever. But I'll lay my bet on 2001.

Do your part - instead of Happy New Year, say to people "Happy Last Year" (as in, last of the millennium).

Not attacking you, but rather the popular view we all are seeing.

Chou.

Howdy rafterman,
It depends on what your trying to accomplish. To meet electrical code in most areas you would use an 5/8" X 8' copper clad ground rod and #10 or larger copper wire, the bigger the better. Aluminum wire is not recommended and will react poorly if you use copper clamps or lugs. For lightning protection the ground wire should run straight to the ground rod with no sharp bends. A good example would be an antenna on a mast or tower along side the building with a large ground wire or copper strap running straight to a ground rod at the base of the mast. A poor example would be the antenna in the middle of the roof and the ground wire running a long distance across the roof and then down to the ground. We ground large Satellite dishes and mountain top repeater antennas using 1/2" dia stranded copper wire running from the antenna or lightning rod directly to a buried ground system with several 8" ground rods bonded together with 1/2" cable. We also use Polyphasor lightning arrestors attached to a copper plate and bonded to the ground system where the coax enters the building and the equipment has survived direct lightning hits. It is always good to ground your antenna system to minimize damage to your house from lightning and possibly drain off precipitation static but if someone told you to ground your ant to minimize TVI, bleedover or to talk further its nonsense. A CB antenna will benefit from an improved ground plane at the feed point but that is different form an earth ground. When it comes to getting a bigger signal out the antenna doesn't have a clue if there is a wire connected to the earth. If you have an antenna that suffers from feed line radiation (Antron 99 and many others) which can worsen TVI and bring RF into your operating area, attaching a ground wire may alter the RF on the coax a little and lessen the problem but the actual connection to earth is not affecting the problem, the hunk of wire is. I think Polyphasor has a web site, you might look them up for some good suggestions.
Have fun,
M!

I have a similar grounding situation with a roof mounted mast. You just
do the best you can with the situation you have at hand. I used large gauge
copper from the mast (paint removed) and across the roof and down to the
cold water faucet on the back of the house using a grounding clamp for water
pipe I got at True Value hardware. That was the best I could do for the
mast grounding.
The radio equipment is all tied to a common buss bar across the back of
my station desk and that goes about 10 ft across the floor (under the
carpet) to a ground rod outside the room in the front flower bed. The buss
bar across the back of the desk is also tied to the AC ground at the wall
outlet. That was the best I could do and so it 'has to do'.
I could have spent many hundreds of dollars on fancy lightning
protection but for economy chose not to. So far so good. I could only do
so much with the budget I had to work with. Good luck.

Like was stated in another remark it would be awful big to build a
j-pole.
you could build a di-pole either at half or quarter wave depending on
your location limits. I have been operating with one of these type
antennas for about 6 years it is very simple to make and if it needs to
have maintenance you just put in some new wire.

I would suggest using 6 volt bulbs if you wish to continue
keeping them wired in series. You could always use the 12 volt bulbs
but you'd need to rewire the power to the bulbs in parallel.Either
way is acceptable. Just what's easier for you.

If you're experiencing a dimming of the lights in the radio on
tx I would not worry too much about it if the output power and
modulation are satisfactory to you. You might squeeze a tad bit more
out if you want to go inside and repair/redesign the hi current
paths through the radio. Could be a fair amount of work for the
little extra that you might benefit from it. This is assuming that
things are normal in the power supply and radio.
I need to add that the voltage drop in the radio is not just a
function of the traces carrying the + voltages but the - (ground)
traces throughout the radio as well.
If you are still bent on stopping the lights from dimming
slightly then you'll need to jumper the hi current carrying traces
with a section of wire so as to increase the size of the trace to
something that will carry the current without a voltage drop. You
may well need to reinforce the ground paths from the hi current
using devices back to the power cable ground trace. You need to be
kinda careful here because unless you just follow the original
layout, you could end up with some ground loops and strange
happenings from the radio audio section and receiver.
Next you'll want to devise a better on/off switch circuit that
uses a relay with better contact area than what you normally get
thru a cheapo on/off switch contact.You can use the factory switch
to operate the relay.
All of this presumes you have a power supply and power cord that
can carry/deliver the current you need without allowing a
significant voltage drop.
Good luck in your endeavor. BobC.

> lowly freebander. Evidently, I'm not worth the effort.

Look Landshark, most people get their license without the help of others. Having someone to help you is an extra, not the norm. The Technician license test is not that difficult. Get a study guide, spend the time to study it, and you will pass the test.

There is a lot of information on the web that can help you with your studies. My on web site gives study suggestions, and a link to simulated online license tests you can take for practice.

If you feel you must have help, spend some time visiting the local ham club. In other words, they are not going to come to you, you have to go to them. And don't talk about your freeband activities - its a ham club, not a freeband club (they don't want to hear it). I'm sure you'll quickly find someone that is willing to help you with prepare for the test.

Dan, if you think 2 meters is the only option available to the Technician class operator, you need to spend a little time educating yourself. There is a wide range of bands to choose from (six, two, 440, etc.), and a host of communications options on each of those bands (AM, FM, SSB, digital, satellite, moonbounce, and others).

Most hams (in all license classes) also spend time on the CB to talk with their non-ham friends. That fact does not take anything away from the wealth of options and activities available through ham radio.

I have the following items for sale:

Cobra 148GTLST $85+shipping (Sale Pending, but still accepting inquiries)
Only a year old, stock configuration, and in great condition

Cobra 200VM w/Dual Cooling Fans $100+shipping
Only a year old, got it with the above radio, and is also in great condition

Uniden PC66XL AM $40+shipping
I own two of these, they're awesome radios. They are LOUD! Look good and
smell good. Not to mention they work good too!

Uniden Washington AM/SSB $150+shipping
This is my prized posession, but I need the money. It's a damn good radio.
It has the frequency expansion kit installed for both uppers and lowers,
sliding clarifier, and a nice lollipop Cobra CA-72 Dynamike.

You can view these items at: http://internet.oit.edu/~jouc/forsale.html

You can e-mail me at: jouc@oit.edu

Happy New Year!

I use my legal CB in the car on the highway to get traffic reports, and help others. I use the one at home for general conversations. I also have never "stooped down" to the level that some people have, I do my part to keep CB clean.
I am interested in getting a HAM license, I have a few friends who are licensed amateurs.
I will probably use both services, each has its merits.

I think the main reason most of the complaining HAMs dislike CBers is because of the "bottom dwellers" of the band, the ones who cause all the disruptions, etc. However I do not think that it is fair to lump every single person with an 11 meter radio into one group and call them all inferior and menaces to society. There are still many decent people on 11 meter band. Just like there are still many decent people on the amateur bands, and many decent people still on the internet, and many decent people still on the freeways, and so on.

Just because you run into a few jerks who are being rude and selfish, do you completely turn away from your hoppy/service? I would hope not. If that was the case, there would be a lot less traffic in rush hour! Probably no rush hour at all, because everyone stopped driving their cars because one rude guy cut them off or some similar rude act. Of course this might be beneficial to the environment, but that's not the main point...

For example, the Internet. There are many offensive people on the internet, yes. But do we stop hooking up because of that, or do we take a stand, and keep our part of it decent, and be an example? Do we encourage others to get an ISP account, and join in the fun of email, web, newsgroups, etc?

Or do we tell our friends to never touch the internet because we saw/heard a very rude person in a chatroom?

>
> But I guess, what good is a club if you let everyone in, right? Keep
> some that want in out, then we superior!

The problem isn't the internet, or the ARS, or CB, or whatever. Its people in the world who have no respect for others, who think being rude is "cool". As long as there are these kinds of people, we will have to deal with them, no matter what medium we are using. Keeping ANY and ALL newcomers out of a particular hobby / service might keep out the 1% or 5% of rude people, but then what kind of hobby/service is it if good new people can't join, if we can't pass it on to the next generation?

I for one am excited to get an amateur license and learn more about electronics and radio, and meet new people. Sure there might be a few rude people out there, but when I meet a decent person who I have a nice conversation with, then the bad experience is pushed aside and forgotten.

From what I've seen, the LT has its knobs rearranged. They are all "double" knobs now, instead of just the 2nd and 3rd. This makes room for a front mount mic, which is a good idea IMHO, especially for mounting in tight areas in a vehicle.

Also the LT has backlit knobs and meter and LED channel indicator, green light kind of like the Cobra Nightwatch line. Although the Uniden LT's with backlight use different technology than NW. Other models have been upgraded as well, such as the 68 and 78 LTs and WXLT's.

If I didn't have a Grant XL already I would go for an LT.

Next on the list, AM, followed by SSB and NBFM.

By 2100, any mode other than Quantum-modulated pulse modulation (QMPM).
Also, no knowledge of any mode other than QMPM should be tested, as being
archaic.

The FCC and Congress care little for Amateurs as numbers or Voters...
Hell...At best, Amateurs represent a couple of hundred thousand voters...
very divided voters at that! ...NOT EVEN A DROP IN THE BUCKET in National
Elections!

Right now the FCC is dealing with years of budget cuts... therefore, right
now the FCC cares mostly about budgeting it's resources... Amateur
licensees contribute NOTHING towards FCC budgets. (for that matter...
neither does CB, but the FCC has no cost involved with CB other than
occasional enforcement as in the ham bands, where fines tend to pay for
costs incurred)

Not so fast Cap'n. A General class license held either now or after April 15 will get you only General Class frequency allocations. Not -ALL- HF bands as you stated. The April 15th rule changes do not change any of the band plan allocations that are already in place.

Now my experience in the Detroit area in the late 50's early 60's was totally different. The local 6 meter club had a number of hams who seemed eager to help someone in their teens get on the air. They gave technical assistance, sold equipment for whatever I could afford to pay, and even loaned stuff when there was no money available. On the air, I felt like I was always treated as an equal even though I was a teen and the rest were older.

As I see it, the issue is that some CBers fail to be as observant of the rules as perhaps they should. From the amateur perspective, gentlemanly conduct and self policing are high priority (spare the comments about the handful of idiots often referenced on 14.313). The vast majority of amateurs attempt to abide by the rules and if they fall short--perhaps transmit too close to the band edge or get too broad, it is usually by accident or oversight. Amateurs would be happy to welcome any CB op who wishes to join the ranks; there is allot more to do electronically than just push the ptt and yack. The concern is that once bad habits are acquired, they won't easily go away. Whether it is phone, cw, rtty, slow scan television, or satellite, the hobby is much more controlled and polite than Channel 19.

CB has a huge population of people who have no intention of ever doing anything more than plugging in a CB and talking. Heck, there are tens of thousands who don't have a clue what is really happening when they push to talk. BUT, there are also other tens of thousands who do, and have an interest in expanding their knowledge. To these folks, I suggest that you check out the hobby. Please check the CB behavior at the door though.

This year will be interesting. The dawn of the no-code tech and the low-code extra.

Well Charles, this is not a popularity contest. You implied in your
post that you believed that those who used CB radios could not already
be licensed as amateur radio operators. As an example, I could post a
message in NG's you frequent the most saying something to the effect
of:
I invite ALL licensed amateur radio operators to become HETEROSEXUALS.

This was only an example, feel free to decline.

Paul

>

I think this guy is saying that the point of ham radio ISN'T the hurdles per se, but what they are supposed to represent -- knowledge about RF, communications protocols, band plans, and such. It is NOT supposed to be an exclusive club with long rituals requiring lots of effort but unfortunately that is what it has become (well, the club part anyway - and the previous hurdle of higher and higher code speeds for more voice privileges was just gratuitous, but served the desires of people trying to build an exclusive fraternal organization on a hobby whose reason for existance is based upon INCLUSION!).

And that is why it is under attack. And that is why the FCC revamped the licensing scheme to the minimalist one it is set up for: 5wpm test to satisfy the international treaties, and a bunch of multiple choice questions to do the rest. I would figure that it would have been better to have one pool of questions required to get the 50MHz+ certification, and another to get HF + the treaty junk (5wpm code). We went with 3 tiers, which is still a bit elitist, but hey, it is a move in the right direction.

Now, if there aren't increased numbers of hams, I would expect that more ham radio frequencies to be lost to commercial services - so people who are not welcoming of new hams, and try to be elitist about it and ignore, newbies are only hurting the hobby by this irrational behavior and indeed

threatening its existance!! If you want to have a club of old timers, elitist, requiring new members to do lots of rituals to become one of the gang, there are a lot of clubs and fraternal organizations out there whose very purpose is what you crave! I suggest you join them to get that aspect satisfied and then concentrate on making ham radio even more egalitarian and open than it is becoming! I'd love for ham radio to be in the position in 20 years of having the bands way overcrowded due to increased use (not loss of bands!) so we start experimenting with ultra-narrow band technologies to allow everyone to use the stuff!!

Yes, that is just what I was thinking. By having lots and lots of young Hams, losing lots of spectrum would be played as "the US destroying our technological wireless future" but with a small number of older hams and relatively few newbies, it gets played as a bunch of old folks complaining about losing an ill gotten benefit.

Right now, a lot of the interest is in the microwave bands - so I expect to lose most of that in the next 10-20 years unless we start using it, but with the damage we have done to the hobby by being so HF focussed (even to the point of requiring morse code at any level to get non-morse access for so long), even now, there is virtually no experimentation being done by average hams so no public benefit - and depopulated microwave spectrum - so that is gonna go pretty soon.

Prince IS a reprobate and there IS a better Y2K song, I never heard it during the skip Hoop-LA ! The PERFECT Y2K song goes like this: "It's 1900, yesterday..." It was out in '70 or 71 & I don't know WHO did it OR it's correct title.
Does anyone know the song title to these words & who sung it? E mail and post it under here IF you do. IS that the best Y2K song there ever was, or was there a better one that reprobate Joel's "we didn't start the fire (sin)"...but we CAN stop it! What a bunch of 1900's spewage in Joel's song! CB was born late '58! Dave!!!!!!

Interesting bunch of replies. Most of them were kind. Someone got on to me for saying chow instead of ciao. TECHNICALITIES! I suppose it made someone feel better to correct my OBVIOUS mistake. Someone else made a smart remark about waiting another year until the millennium. I think I can properly come to the conclusion that this year has been the most widely accepted year as "The New Millenium" according to the masses and news media. I suppose there will be a FEW people out there saying "Happy New Millennium" next year only to be scoffed at and made fun of. HAHA. Heck, I personally believe its really 2006, but I'm not complaining. I think a few of you missed my theme entirely because of the technicalities. I was just trying to say that I wished everyone "good luck" (even though I don't believe in luck) because many of us were a little tense about the Y2K bug. Plus, I was just hoping everything would be ok with the internet so we could all come back here to post our great messages. Personally I'm glad its all over with and we can go on with our merry lives. I know there may be a few glitches here and there, but for the most part, everything is just great. Hey, to the few of you who just had to correct me - no offense taken. Have a great year everyone! Have fun with those radios!
Chow! (or ﷺCiao!)

Can anyone tell me the most effective way to ground your antenna to an
earth ground?
What is the best type of wire to use?
I have heard that you should use an aluminum stranded wire,is
this true?
Does distance to the ground matter?
is 6' deep,down far enough for your groung rod?
It should be a simple question,but it seems that everyone has their
own ideas.

Thanks in advance.

Rafterman

132. To Newcomer Amateurs In Rec.Radio.CB

Newsgroup: rec.radio.cb
Date: 2000-01-02 00:00:00 UTC
From: yrac@aol.com
Message-ID: <20000102150845.01942.00000722@ng-fr1.aol.com>
Source record: 18006

Welcome. We are glad you found this Newsgroup, and we hope you will enjoy participating. You will find a variety of folks here. Some, like you, have ham tickets but also enjoy operating CB. Others, by choice, do not have a ham license. Many folks in both categories possess great electronics and operating abilities, and they freely share what they know with new folks entering the radio hobby. Feel free to jump in, but please keep all information as accurate as possible.

To save your time (and to avoid flame wars), please be aware of the following:

1. We already know that amplifiers are illegal.

2. We also are aware that Freebanding (or operating outside the CB allocation) is not legal, and is done at the individual's own risk. And we know to stay below 28.0 MHz to keep away from the CW DX window.

3. Yes, we heard that the Code Requirement for an Amateur license is being relaxed in the form of a speed reduction. Some may take advantage of this; others will not. Failure to seek a license is not a negative reflection upon anyone. And by the way, CB operators do not consider it a "move up" to get a ham license. To us, it is "moving over", or picking up extra frequencies.

4. Yeah, we know there are folks on 11 meters who are "rude, crude, and socially unacceptable". CB, by its general nature, is a cross section of the population. There are some crude folks on the ham bands, also. But that doesn't mean all hams are that way. We accept this about you. We ask you to accept this same premise concerning us.

5. Likewise, there are some folks on 11 meters (and in the NG) who ask questions that you may consider to be "stupid". Please be polite and if you answer, give accurate, non-judgemental responses. You, yourself, were new once. (Remember that time you were giving signal reports on 2-Meters while someone adjusted an antenna? A more experienced ham gave you a gentle reminder that your S-Meter was reading the output of the repeater--not the signal coming from the antenna being tested.)

Finally, be prepared to learn things in this NG. After all, when you are confined to a narrow set of frequencies on a single band, you get pretty efficient at designing radios and antennas, and you develop some very advanced operating skills. On CB, one does not have the luxury of "dropping down a band" to circumvent changing propagation or to avoid interference.

Best regards,
Yrac

133. SELLOUT AUCTION

We're selling out all
but a few test equipment items.
Right now you can bid on a Tram D201A
The next item up for auction is:

One lot of old CB pictures and brochures.
A few 1 of a kind items.

See list at:
http://www.efjdevices.com/sellout.htm

CB literature auction begins
1/4/00 0:30 AM
ends 1/6/00 12 M.

See bidding instructions at:

http://www.efjdevices.com/auction.htm

Minimum bid is $35.

Thanks to all the bidders. If you are a bidder you can
request highest bid thru email.

EFJ Devices

134. For Sale, OR Trade, GALAXY SATURN TRANSCEIVER PACKAGE!!!!!!!!!

This radio is the 6 band version, goes very low and very high. It also has variable power output adjustment (for carrier) and it has a PEP swing of 33 watts on A.M., and 35-40 watts on SSB (single side band). Its also has been retrofitted with a Demco Electronics (tube type) microphone modulator, which directly mates with an Astatic D-104 SE (silver eagle) desk microphone. This package is extremely capable of VERY, VERY, LOUD AUDIO LEVELS. I was the sole original owner of this set-up, and can guarantee you that NO-ONE has played around with screwdrivers inside this baby..... EVER..... The original investment I have into this rig is 790.00 dollars. Im willing.to sell it for a firm 465.00 dollars, and you pay shipping.OR.... I would consider a trade for the following scenarios,(1)- A Realistic Pro-2004 scanner PLUS 200.00 dollars,(2)- A Realistic Pro-2006 scanner PLUS 100.00 dollars, (3)- A Tram D-201 C.B. base, EVEN TRADE, and (4)- A Tram D-201-A C.B. base, at an EVEN TRADE, These are the ONLY radios that interest me, and PLEASE DO NOT OFFER ME ANYTHING THATS NOT ABSOUTELY MINT CONDITION, INSIDE AND OUT. All serious inquiries can contact me at my e-mail address (which i check daily) at jj475171@aol.com, and thanks for reading my posts, Happy New Year Everyone, Yours in the hobby Frank

It is questionable whether the FCC listens to voters since none of the FCC employees are elected. Yes their budget comes from Congress but they are well down in the noise (and money) compared to some of the other players in the Federal budget. Amateur radio matters are even further down in the noise. The FCC's main concern is with commercial interests and major telecom issues.

The only problem is the attitude of some of the ham's out there. I've run into a similar situation concerning webtv. Seems that since I use webtv, I'm not a "real" web surfer. As if using a pc makes someone a better person.

I can understand the feelings of some of the old-timers - they worked hard to get to where they are - but to relegate newcomers to second class citizenship because of a change of protocol doesn't do much towards the advancement of the hobby. Personally, I've always been intimidated by CW. I don't know anything about it. I remember a college instructor talking about ham radio every once in a while in an effort to get us involved, but we were just a bunch of electronic techs getting into the computer thing. We had no time for a hobby. He pushed the fact that a no-code exam was available. Why? To create interest. Had my schedule not been so full, I would have taken advantage of the opportunity.

What's so frustrating is, even before the changes, I could never find anyone to help me get my license. I'm in WV, my instructor was in NC. I think there is a local ham club but what can I say.....I'm just a lowly freebander. Evidently, I'm not worth the effort.

Wait a minute....
Buy a cb radio and talk legally without a license.

-------Or-------
Buy a ham radio (Cost more)
take license test (Fee too probably)
Risk felling license then you are screwed

Better get your head out of the sand and into century 21,
Bill. The FCC just effetively delivered the Amateur Radio
Service over the the CBers carte blanc, delivered on the
no-code platter. A little memorization and now even the most
illegtimate illiterate honyok is in, all the way to Novxtra
class.

145. Re; Alternator Noise Assistance

Newsgroup: rec.radio.cb
Date: 2000-01-02 00:00:00 UTC
From: John Frank <jfrank@mailbag.com>
Message-ID: <01bf5568$4e1f5820$2f1746c6@jfrank.bind.net>
Source record: 18019

Many late model Fords have plastic fuel tanks that provide no shielding from fuel pump noise. (The electric fuel pump is in the fuel tank) Here's a suggestion: alternator noise will vary with engine speed, fuel pump noise is fairly constant over a range of engine speeds. If the noise varies with engine rpm, it is probably alternator noise. If the noise is constant at different engine speeds, it may be fuel pump noise. By putting the antenna on the rear bumper, you placed it near the fuel tank and a potential noise source.
Good luck,
John

146. Galaxy Saturn F.S. or trade

Newsgroup: rec.radio.cb
Date: 2000-01-02 00:00:00 UTC

yeh and most of the so-called hams starting the wars on here are themselves
cb operators on the side, why do you think they are here, they just have a
no code tech license and can do 2 meters and sometimes spend time on cb
,the problem is that they can't seem to make up their minds where they
belong
so they stay in limbo going back and forth. i guess they thought being a
ham
was kind of like going to valhala or something , who knows. i guess they
didn't
invision that they could actually get bored on the ham bands and so they
come
back to 11 meters and try to act like they are special or something simply
be-
cause they passed the no code license test, well who cares. get a grip.
i have not seen one general class or above ham
guy get on here and start complaining about anything and you know why? i
have said it before and i say it again. they do not , i repeat, do not care
what is going on in the 11 meter section of the radio bands and as long as
we keep this power thing in the 11 meter slot , they could care less, if you
want to know, ask them. they will tell you and they will also say that the
hams who are here starting stuff are a bunch of ignorant tight asses with
nothing
better to do, dan the ice cream man with the dan electro guitar is off the
key.....

Most of the people who are coming of age for HAM radio were not born in the 50's
and 60's.

I am 52 years old and until an accident laid me up for almost a year I had no interest
in ham radio or even CB. I chose ham radio because we all know the mess on CB. No
one who professes to like Ham radio wants to see it go the way of the CB. I am currently
a no code tech, but I will be taking my test for General before the 04-15-00 deadline. I
have had a hard time with the Morse code because of a hearing problem, but I will still try.

Change can be the most painful of experiences or it can a pleasant surprise. If Ham is
to survive then we all must be open to change. Those who are at the top of the Ham hierarchy who will soon be reduced to general are going to hate it.

I wonder if we will ever stop P+Moaning about what was and do what is needed to make sure our hobby flourishes. The choice is up to all of us

So this 40 year old information has what to do with anything? This attitude is the problem. "Things were fine 40 years ago when I started so why change anything." The last time I joined a club a couple of years ago (are you listening McHenry County Wireless Association in Illinois) they took my money but never added me to the membership roles. I wasn't quite 50 at the time so I guess I didn't quite meet the minimum age which probably averaged 65.

I have a question for you. Do you have your antenna in a tree or on a metal pole/tower?

The best way is actually to use waht is called grounding strap. You can buy it at a local electronics shop or you can make it buy using the flattened shield out of a scrap piece of coax. You will want to make the length of the strap a non resonant length and yet make it as short as possible. This is what I did when I had a base station set up and it worked quite well.

Someone else may know of something else that may work well for you as well. And yes 6' into the ground will be sufficient, however, the deeper the better. I used an 8' copper coated steel rod that I got from Home Depot and drove all but 6" into the ground.

170. Problem with a Midland 77-113

Newsgroup: rec.radio.cb
Date: 2000-01-02 00:00:00 UTC
From: 4xFord <4xFord@bigfoot.com.nospam>
Message-ID: <84onkk$56g$1@nntp1.atl.mindspring.net>
Source record: 18044

I have a Midland 77-113 Radio. I'm mot getting anything on the 40 CB channels, but the weather service stations come in fine. I also don't think that it is transmitting (I used a shortwave radio and tried to listen for my TX). I recently moved this unit from one vehicle to another. It worked fine before and after the move, but stopped working about a day after the move. I put it back in the original vehicle with the antenna and cabling that had never been moved, and it still didn't work. The new vehicle has a new antenna and cabling. I also tried a spare cable and antenna that I had laying in my garage.

Any ideas???

TIA, Bryce

I'd like advice on eliminating engine noise on my new CB. I know it's not the antenna 'cause it does'nt go away when I unplug it. I bought a Radio Shack filter but it's the same. My power comes directly from the battery and the ground looks like its good, on the frame. I also hear my blower motor.

Maybe because a lot of us also use our C.B. radios and also. Not all of my friends have an amateur licence - and I am not going to stop talking with them because they haven't got their licence. Also to be honest there are still a lot of fun things that can be done on C.B. Not to mention why should I disasociate myself from the hobby of C.B. just because I have my amateur licence?

This treaty seems to be broken rather regularly, here in VK / 43 division (pick whichever method of country identification you want) one class of our non code hams are permitted to operate in the FM segment of 10 metres which to me is part of the HF portion of the spectrum. Now Australia still subscribes to this outdated treaty, however we have loopholes like this - the sooner we follow your lead (and then take it further by abolishing the requirement for code) the better off we will be. This rigid adherance to an international treaty by the US is unusual as the US doesn't always follow these treaties - it will usually break them if the treaty doesn't work for them - the trade treaties, specifically the tarrifs/import restriction area is a good example of this. (No I am not having a go at the US for this issue - well only a small tiny insignificant one at the most). Cheers.

I just wanted to throw in my opinion. I think the post by Charles was with
good intentions. I use CB bands, and am also a no-code tech.
I like both. When it gets cluttered on the CB band with hundreds of people all
talking at once its nice to check out 6 meter ssb or 440.
and for the person who said no code techs can go to 2 meters.. well there are
many more choices than just 2 meters for technician class operators.
Its lots of fun on ham and the two written tests I had to take were not very
difficult. especially if you have learned things about radio from being on CB.
The fee for the license was only 6 dollars and some change.. get out and take
the test. you will be glad you did. Hope to hear more CB operators on the
ham bands.. (the ones who aren't already hams of course)
peace

There is a difference between a 2970 and a 2970DX but all I know so far is that the 2970DX is advertised as a 12 and 10 meter radio. Copper only had the RCI 2950/70 not the DX. RCI says that only Ham Radio Outlet offers the 2970DX but I have not been able to get any info from them or RCI either. Emails have been sent. Any info provided by this NG would be appreciated.

Source record: 17934

Ford has a Technical Service Bulletin for fuel pump noise in many
Ford cars and trucks. The fix may be under warranty. Fuel pump
noise sounds like alternator noise. To check and see if it is fuel
pump noise turn on your radio, turn the key to the spot just before
the car starts, the fuel pump will run for 2-3 seconds and then shut
off. Look at the TSB's for all brands here www.alldata.tsb.com -
The RFI filter kit is at Ford, Part Number E7PZ9357A
Thomas Distributing also has an RFI filter that is said to work
on many vehicles. Find them on the net www. thomas-distributing.com -

I'm assuming that your having trouble making contact with other CBers. If you want good performance you have to get a good antenna. Use a magmount antenna like a K40 on your car, and throw a 5 foot Firestik indoor base antenna kit on your back deck or porch at home. Your little handheld will work 500% better!!!!!

I note you go on about knowledge when wht is being done it
remove not a matter of knowledge not of physhical skill. Code testing
has nothing what you just mentioned. which are good things, likely to
be discarded by the FCC reacting to the Morse Code uber Alles crowd
>

>years away)

Sorry the treaty has no such requirement merely that code be tested
for "by ear" and "by hand" the first of those requirements is NOT meet
by the US in the case of at least some of the Deaf. The FCC could have
with a big strech (like the ARRL's no test at all for HF CW access
idea) given a written test of some sort, or 1 char per sec test one
sec long, answer is known in advance if they had pleased. Thier are
reasons to keep 5PM as much as I would have liked to see the FCC
eliminate the requiremnt in practical terms as these sugestion would
have done. But I not am really surprised by what the FCC did

Indeed I belief Ed Metzger my director is wrong in suporting
Code requirements but I do firmly believe that the idea of as much
Code requirement as is politicaly possible is ARRL policy. It is
different from trying to Go down with the ship (all of the ARS) on the
issue of code, but it remians in favor of code testing requirement

No, the fines go into the general fund and are not allocated to support
FCC activities. Wish they were. Even more significant is the $billion/yr
the FCC gets in station licenses and frequency auctions also is gone and
not used to support the FCC. This may be an area where a few thousand
letters might help. Let the FCC keep some of its "earnings".

Hi all !

As u probably know in France we r dudes (lol) and our government do not allow us to use more than 40 channels even on a 120 ch tx !

So we find everywhere on the web mods for extra channels for the Grant XL (8719 chipset) but considering the fact u already have 120 channels.

On the Grant XL (which I own) I only have 40 channels instead of 120.

It must be very easy to upgrade it and restaure all channels but I need to know how ...

So pse, help me ...

The k40 system is a good system to get. K40 backs their product better than Wilson. There is a power handling limitation on the k40 but for most cb'rs that isn't a problem.

The only weak link in the k40 antenna is that if hit with a tree hard enough the tower on the load will break. This causes the antenna to stop performing. But the antenna has a supurb warranty system so buy with no hesitation.

You won't be sorry for either choice. If you find the K40 a little too tall the Wilson Short load stinger fits nicely and tunes well.

Happy CBing.

Bryce,

Do you have a channel display on the cb part. Check that you didn't put it in PA if it has one. Then I would take it in for
a: cold solder joint repair inside the radio.
Common affliction
b. replace the blocking diode that blew when you hooked it up or unhooked it. Follow your sequence of actions. Did you cut the radio out of the vehicle when you moved it? Is it on a cigarette lighter plug?
The weather radio is a separate radio inside the cb and will work if the other is not.

Good luck. You can cross the voltage doing several different things when moving a radio. It is a common mystake done by many and nothing to be ashamed of. The repair if that is it shouldn't cost too much. Less than 20 dollars.

Heck, 2000 is "the turn of the century" so let's just party all year long,
OK? I'll give you that the new millennium hasn't started yet, but
1999->2000 just seems so much more impressive than 2000->2001. As the
actual date is uncertain because of historical inaccuracy and calendar
changes, I don't think I'll bother with actual millennium celebrations much.

Let's see what's wrong with this statement......

First, you make an assumption that those of us that do not hold CW up to
the same reverance as you do, are somehow "idiots". Then you make an
even more radical ASSUMPTION, that these same people are going to
somehow ruin ham radio.

Based on what? Where is your proof?

You are exactly the type of close minded ham radio bigot, that I was
refering to.

If you can't keep to the issues without letting your runaway emotion
cloud whatever logic you may posses, then you'll never progress beyond
your initial prejudice.

Dave

Get it in YOUR head, there is no specified CW speed in the
"international treaty" It could be as little as 1 WPM and still satisfy
the requirements.

The FCC's recent announcement that 5 WPM will be the new limit for all
HF classes of license is in line with this.

5 WPM is not difficult to learn, and is usually not a real burden. But
anything above that requires dedication, concentration, and wasted time,
if one only desires more phone privileges.

As far as it goes, there's no reason to think that the international
treaty won't change as well at the upcoming WARC.

> I upgraded to tech Plus 2 years ago.
>

Unless you actually LIKE CW (If you did, then upgrading your code speed
wouldn't be a chore) all those "CW" bands are useless. The only phone
band that tech plus gains is 10 meters, which is virtually identical to
11 meters in propagation. It's hot when the sunspots are in, dead when
they aren't.

The new restructuring gives you a lot more stuff, which makes learning 5
WPM more justifiable.

213. WHERE CAN I BUY POWER CORD PLUGS???

Newsgroup: rec.radio.cb
Date: 2000-01-03 00:00:00 UTC
From: icemanrrc@aol.com
Message-ID: <20000103095007.12841.00000012@ng-fh1.aol.com>
Source record: 18062

I need just the radio plug part, no wires. I am trying to build a heavier gauge power cord that will handle the voltage pull from my radio. I was just going to open up the plug that came with the radio, but it doesn't have a way to be opened so I can't replace the factory power wires with more heavier gauge wires. Does anyone know where I can buy a new plug that can be opened?

> Code requirement as is politicaly possible is ARRL policy.

That is exactly what the ARRL's "compromise" proposal was ...
as many classes of license and as much code as they thought
stood a snowball's chance in hell of getting throught the FCC.

They guessed wrong.

The R&O almost exactly reflects the NCI proposal (T/G/E, 0/5/5),
with the only thing of any note that we asked for that we didn't get
being the "sunset clause" and that's not that big a deal since it wouldn't
have "kicked in" until after the WRC deletes S25.5

> It is different from trying to Go down with the ship (all of the ARS) on
the
> issue of code, but it remians in favor of code testing requirement

That is why I stated in a recent post that this is a (somewhat) different
ARRL than existed at the time we lost 220-222 MHz. That ARRL
took an "over our dead bodies" attitude with the FCC and we all
paid for it. I'm glad the current ARRL BoD is a bit more flexible.

Get it in your head, there seems to be plenty of unused space there, you were complaining about a CW requirement period. As long as the ITU treaty requires CW for access to the HF bands and the U.S. abides by the treaty, there will be a CW requirement for a ham license at some speed, period. Where in any of my post did I say the treaty had specified speed requirement?

216. Re: 10m =new freeband under new rules

The code requirement will always be a stickler. Bitching on both sides. It was about time the FCC updated the rules. If you want to get more folks into ham radio AND keep it going strong, your going to have to make concessions. I have been in CB for many years and love it. If the AARL and the hams want to keep the CBer's out of there territory, then it might help to add more frequencies to the cb area. I think 26.500 to 27.500 would be perfect for the next 25 years or so. If you keep the cb at just 40 channels then they will continue to invade the ham territory. The testing is always about separating the CB and the Ham operator. Some don't care to go into ham and are perfectly happy were they are at. Others got tired of 40 channels and either freeband or get the ham ticket. The code requirement will eventually disappear. Until then, we live with the decision and move on. Have a Happy New Year and keep on talking which ever band your on.

I'm assuming that your having trouble making contact with other CBers.
If you want good performance you have to get a good antenna. Use a
magmount antenna like a K40 on your car, and throw a 5 foot Firestik
indoor base antenna kit on your back deck or porch at home. Your little
handheld will work 500% better!!!!!

Agreed!!! ...But a better radio will help too.. Handhelds leave a lot to be
desired on the reception end and many don't do 5 watts.

Well, I guess I should have spelled it our better a general would have
access to ALL HF bands (true!) ....And have SSB privileges on much of that
spectrum. I didn't want to go into defining each and every band segment.

For the price you paid for the GE handheld you could have gotten a
Uniden PC501XL and a 3 amp power supply. This would have worked
a lot better.

But, if you need a handheld, you need a handheld and thats all there
is to it.

*
* An A99 IS a couple stacked verts,1/2W over 1/4W.Hams often use verts
*in phased arrays although I have never heard them say "co-phased".
****

If an A99 is a 1/2W over a 1/4W then the two sections must be loaded section. If full length for each section the antenna would have to be 27 feet long. From the piece that I looked at when mine was hit by lightning about 4 years ago there does not seem to be any loading elements. That tends to lead me to believe the antenna is an end fed 1/2W antenna with a very necoe matching network.

Yes it is posible to phase two A99 antennae. The best way is to adjust each one
to be matched to 50 Ohms and then determine phase angle and spacing.

John that is a different situation. Most base station antennae have some sort of matching network at the feed point to adjust the feed point impedance. Very few if any mobile antennae have adjustable matching networks at the feedpoint to adjust feed point impedance. Most loaded mobile antennae are adjusted to certain length based on the load coil's reactance. It is necessary to keep the desired length as per manufacturers requirements. This will allow the radio to load the coax properly with slight adjustment of the whip length. Placing an SWR meter at the input of the coax one can adjust the whip length to a point where the transmitter is convinced that it can properly load the coax. At that end the transmitter thinks it sees a 50 Ohm load. There maybe higher SWR at the antenna feed point but the tranmsitter is happy.

*The FCC made known its restructuring decision today and it sucks!
*
*I Blame the ARRL!
****

I think you are placing the blame on the wrong entity. If any body needs blame it should be the FCC. In your point of view the whole amatuer world has now come crashing down. If that is your opinion maybe it is time that you not renew your license and give up the hobby. The FCC is thinking beyond your narrow minded thinking and self gratification. They have the insight to realized that left as is, the amatuer radio service will be a foot note in history of radio in the next ten to twenty years. Maybe you will be dead and gone by then and that no longer is of your concern. For the first time in twenty years someone has finally realized the the amatuer radio society in the US will be extend as the Dodo bird by the end of the 21st century. For those of use who will still be arround at least into the middle of the 21st century there is now hope that there will remain an amatuer radio service. I am sorry that you will think of amatures like myself and others who will obtain the full priviledges that the FCC will grant inthe future. These priviledges to you will be obtain by means that in your opinion is cheapened. It is cheapened by the fact that I and others to follow will not have to endure that hardship that you had to. This may well be true. CW, while a means of communications, is no longer the mainstay of amature radio today. Is it becoming a lost art? Most likely. Is it a requirement that high speed proficiency is required for advanced priviledges in other forms of communications? Not hardly. The days where amatuer radio shared bands with commercial maritime ships are long gone and past. Then the need to identify ships in commercial enterpriose and not to interfere with them has long gone. CW will always be a menas of communications. So will AM as well as newer digital forms of communications. The radio service has evolved from a time of experimentation to that of more of a hobby. Experimentation is and will never be lost. Experimentation fosters new ideas. The amature radio service has lost that zeal. I think the service needs an infusion of newer more energetic members. Agreed there will alows be those that are less desirable as some may think. Do we close off the whole bands to only those that will meet a certain criteria? then that smacks of the prejudices of the early 20th century. From an outsiders point of view amature radio has become an elite good ol boys network. Sommething like the exclusive country club atmosphere of the high society.

We now have entered into a new era. I think the FCC has made a bold and daring step in amature radio. While many will applaud, some will shudder in fear of what will happen. Remember this no one is twisting your arm to be a member. It

is become obvious that the FCC went farther than many wanted and to some it may not whave gone far enough. As for me, I am pleased with the ruling. I think it give amature radio a channce to survive well into the 21st and even into the 22nd century. What will happen in the future? No one knows. This has been needed for the last twenty years and now it has come. We have no other choice accept it by be ing a part of it or reject it by not being a part of it. It is your chjoice.

regards
james

WA4BZJ

*
*
*NEWINGTON, CT, Dec 30, 1999--Amateur Radio will get a new look in the new
*millennium. The FCC today issued its long-awaited Report and Order in the
*1998 Biennial Regulatory Review of Part 97--more commonly known as
*"license restructuring." The bottom line is that starting April 15, 2000,
*there will be three license classes--Technician, General, and Amateur
*Extra--and a single Morse code requirement--5 WPM.
*
*"We believe that an individual's ability to demonstrate increased Morse
*code proficiency is not necessarily indicative of that individual's
*ability to contribute to the advancement of the radio art," the FCC said.
*
*Besides drastically streamlining the Amateur Radio licensing process, the
*FCC said its actions would "eliminate unnecessary requirements that may
*discourage or limit individuals from becoming trained operators,
*technicians, and electronic experts."
*
*Although no new Novice and Advanced licenses will be issued after the
*effective date of the Report and Order, the FCC does not plan to
*automatically upgrade any existing license privileges. The
*ARRL had proposed a one-time across-the-board upgrading of current Novice
*and Tech Plus licensees to General class, but the FCC declined to adopt
*the idea. This means that current licensees will retain their current
*operating privileges, including access to various modes and subbands, and
*will be able to renew their licenses indefinitely.
*
*Starting April 15, 2000, individuals who qualified for the Technician
*class license prior to March 21, 1987, will be able to upgrade to General
*class by providing documentary proof to a Volunteer Examiner Coordinator,
*paying an application fee, and completing FCC Form 605.
*
*The FCC's decision not to automatically upgrade Novice and Tech Plus
*licensees means the current Novice/Tech Plus HF subbands will remain and
*not be "refarmed" to higher class licensees as the ARRL had proposed. The
*FCC said it did not refarm these subbands because there was "no consensus"
*within the amateur community as to what to do with them.
*

*As it had proposed earlier, the FCC decided to lump Technician and Tech
*Plus licensees into a single licensee database, all designated as
*"Technician" licensees. Those who can document having passed the 5 WPM
*Morse code examination will continue to have the current Tech Plus HF
*privileges. "If documentation is needed to verify whether a licensee has
*passed a telegraphy examination, we may request the documentation from
*that licensee or the VECs," the FCC said.
*
*In addition to reducing the number of license classes from six to three
*and eliminating the 20 and 13 WPM code tests, the FCC also will reduce the
*number of written examination elements from five to three, authorize
*Advanced Class hams to prepare and administer General class examinations,
*and eliminate Radio Amateur Civil Emergency Service (RACES) station
*licenses. RACES will remain, however. "After review of the record, we
*conclude that we should eliminate RACES station licenses because RACES
*station licenses are unnecessary for amateur stations and amateur service
*licenses to provide emergency communications," the FCC said.
*
*Under the new licensing scheme, there will be four examination elements.
*Element 1 will be the 5 WPM Morse code exam. Element 2 will be a 35-
*question written test to obtain a Technician license; Element 3 will be a
*35-question written test to obtain a General license, and Element 4 will
*be a 50-question written test for the Amateur Extra license. The FCC has
*left it in the hands of the National Conference of VECs Question Pool
*Committee to determine the specific mix and makeup of written examination
*questions. Current Amateur Radio study materials remain valid at least
*until the new rules become effective in April.
*
*The FCC's new licensing plan means someone will be able to become a ham by
*passing a single 35-question written examination. The plan also simplifies
*and shortens the upgrade path from the ground floor through Amateur Extra-
*-especially since amateurs will only have to pass one Morse code test.
*
*Elimination of the 13 and 20 WPM Morse requirements also means an end to
*physician certification waivers for applicants claiming an inability to
*pass the Morse code examination due to physical handicap.
*
*The effective date provides a window of upgrade opportunity for current
*Advanced licensees. Between now and April 15, current Advanced holders may
*take the existing Element 4B, a 40-question test, giving them credit for
*having passed the current Extra written examination. Likewise, holders of
*a Certificate of Successful Completion of Examination (CSCE) for Elements
*3B or 4B dated on or after April 17, 1999, will be able to qualify for
*General or Amateur Extra respectively when the new rules go into effect on
*April 15, 2000.
*
*The FCC disagreed with the League's suggestion that it undertake a
*restructuring of operating privileges along with licensing restructuring.
*"We believe that in light of ongoing discussions concerning implementation
*of new and more modern communications technologies within the amateur

*service community, we should accord the amateur service community an
*opportunity to complete such discussions and possibly reach a consensus
*regarding implementation of new technologies before we undertake a
*comprehensive restructuring of the amateur service operating privileges
*and frequencies," the FCC said in its Report and Order.
*
*In its amendments to Part 97, the FCC's Report and Order refers to a "Club
*Station Call Sign Administrator," something that does not exist under the
*current rules and which was not explained in the R&O itself. An FCC
*spokesperson said the Commission plans to issue a Public Notice soon to
*explain the program and to solicit qualified entities to serve as call
*sign administrators for club station applications.

This is the elitist good ol boy society thinking. There are those in the service that want to associate with only their kind. It is somewhat of a prejudicial thinking. I have known Extra class lincensee, HAMs, that their sole purpose to get their extra class license was to get away from the novice and general class bands. They talk only in the extra portion. The new ruling now affects that sphere and thus their little minded world has now come crashing down. They have long forgotten that the amature radio service no longer revolves around them. They enjoy paying 2 to 5 thousand dollars for their rigs that should be no more that $600 to $800 max.

Why should an amature licensee have to derive Maxwell's equations? I seriosly doubt that half of the BSEE today that have been out of scholl for more than 2 years just shudder at that thought. Most I know have stated that Fields and Waves was one of the most difficult cousre in EE. I thought very interseting though.

The same barrier to getting a Tech license has been in place since 1994. The 5 WPM code test. That is not goiung away. They tales of how bad the amatuer bands will become due to the restructuring is a bunch of idiots running around like Chicken Little. My freinds the sky is not going to come falling down and I really seriously think that the amature bands are going to swell into the billoins in the next few years. One estimate that I heard is that there are only 1 million licensed amature operators world wide. Half are in the US. Other counties ahve been simplifying license structures for the last 4 or 5 years. Even the ITU has thought of eliminating the code requirements from the ITU treaty. That subject will be taken up again in WARC 2001. Besides the ITU does not specify any code speed as a minimum requirement. They just mention that it is a requirement. Until that requirement goes away the amature service will not swell to large numbers like the CB band here in the US. The 5 WPM barrier has and will remain a major barrier. As long as the CB band exists the migration to the ham bands from the CB band will never happen. The migration due to the no code tech license in 1994 has been less than 100,000. Not a major ground swell in 6 years. Even with this restructure I still do not see a large influx. Initially there will be some but that will taper off.

*probably only about 30 CBers - there used to be over 1000.
****

Must be nice. I live in a county that has almost a 1 million people. And there is a heck of alot more than 30 CBers here. You can still find about 7 to 8 channels busy most of the evenings til 10 PM.

****
*A lot of this loss of growth/shrinkage is due to computers. Young
*people just have other interests now.
****

I agree here on that. The internet is kicking bothe the CB and HAM participation. IN the near future it will even be more of a threat. 1 Gigabit switches are now starting to roll out. In five years the Internet should be clipping along at 10 Gigabits/second. Voice over IP is now a reality. It is scary to think what is coming down the pike in the next 2 or 3 years. We should see 1 Gigahertz PC's by the end of this year.

Has been that way for many years. Te CB band just made it easier to get in touch. Then again if I remeber correctly the service was intended to be used in short range low cost commercial and non-commercial traffic.

While prostitution is not the most desired commercial enterprise and in most states is illegal, never the less it happens

*Why blame the ARRL? I'm not a member, but it seems to me that the FCC took
*the restructuring one step further than the ARRL wanted.
*Didn't the ARRL want 12WPM for Advanced and Extra and 5WPM for General??
*How about four classes instead of three?
****

That requirement was there to satisfy the board members. The resolution that passed the board was 9 to 6 in favor of the July proposal in 1998. The first attempt failed in January of that year. The proposal sent tothe FCC was a compromise from the ARRL board of directors.

Belive me this has been a hotly contested subject for over 20 years and many are dead set on change. The change from actually sending and receiving CW to that of only receiving was hotly debated. ANd when the CW test became just a multiple guess test that even caused more of a stir.

I have been predicting that this action would take place since 1979. I have had my license since 1976.

****
*A lot of you ol'timers out there think that CW=CB with respect to this new
*license structure. IMHO, you're wrong! HF has a serious learning curve when
*it comes to long wires, tuners, grounding, etc... It's not like you plug in
*the mag mount to the HT and start yacking!
*
*I worked really hard to pass the 5WPM code last month and I have been
*working a little 10M here and there. After stringing the longwire, tuning
*the MFJ941, the DSP-9+ and figuring out the Icom 706, HF is a lot of hard
*work! It's so rewarding to make a distant contact after all that...Don't
*forget the price of HF gear. You can buy several HTs for what a
*run-of-the-mill HF radio costs. You really have to want to get on HF. With
*the learning curve and the cost, I don't think it's going to be as bad as
*some of you think.
*
*Oh well, bring on the Extra!
****

Today the amature radio service has now become more of an appliance operation. One does not need a technical background nor an engineering background to become an amature operator. Some have associated that if one can learn 20 WPM that should make them more responsable operators. I appluad your dedication to learning CW. I met the requirements of 5 WPM 24 years ago and passed element 3

in 1977. I chose not to go further simply because I did not see the need and still don't see the need. I have not used my key since about 1979.

As for the new regulations effective date of 4/15/2000, I plan to have a new HF rig that I am now working on. Completely designed and built by myself. Always wanted to. I have all the equiptment and parts assembled to start building.

PRO-AM makes an antenna that will fit an NMO mount. Their toll free number is 800-543-2197.
Last year I had the same challenge you now face regarding antenna mounts. I bought a PRO-AM
model PLB27 and cut the whip to tune it for CB. It screwed onot the old mount with no problems. It works fine and seems much better than the magnetic mount antenna I had been using
By the way, a model MLB27 should also fit but it is not as robust and may not be as durable.
Good luck, John

From a Ford, I would suspect noise from the electric fuel filter. The
following may help:

73,
Ed Hare, W1RFI
ARRL Lab

Automotive Fuel-Pump Noise

Q: I just bought a new car and installed my HF amateur transceiver in
it. I followed the manufacturerï¿½s installation guidelines and
everything is working out okay, except that when I turn on the engine,
the noise level on every ham band goes up. The problem is very bad on
80 meters, about S7, but it is still S3 on 10 meters. The noise does
not vary with engine speed and sounds the same across all bands. What
causes this?

A: There are a lot of things that can generate noise in automobiles,
but the symptoms you describe sound like they are being caused by a
noisy electric motor. Other possible noise sources are ignition noise
and computer noise (most cars nowadays have computers controlling most
engine and vehicle functions). Ignition noise is an ï¿½impulseï¿½ noise,
and at low engine speeds it would exhibit a ï¿½pop popï¿½ sound. At higher
speeds, this would change into a low-pitched whine. Alternators can
exhibit a similar whine, but in both cases, the noise would vary
significantly with motor speed. The computers used in modern cars can
also generate noise, but much like home computers, the noise tends to
consist of various birdies, bleeps and buzzes that definitely vary as
the receiver is being tuned. The fact that the noise is constant across
each amateur band and does not vary with engine speed points toward a
small electric motor as the noise source.

Most motors in vehicles operate intermittently. If the noise occurred
only when you ran your windshield wipers, for example, you would suspect
the wiper motor instantly. In most modern vehicles, the fuel pump is
electric and it runs continuously as the motor is running. In most
cases, this type of continuos noise is caused by the fuel-pump motor.
It could be caused by other motors in the car, but the fuel pump is the
most likely suspect. There is one test that you can perform that is

diagnostic: Leave the car sitting overnight. With the vehicle off, urn on the HF receiver and adjust for normal reception. Then, turn the ignition switch on, without starting the car. If the noise appears for a second or two, then disappears as the fuel system pressurizes, the fuel pump is the source of the noise.

The bad news is that the fuel pump is generally located inside the gas tank. This usually means that this is not a job for a backyard mechanic. Some automobile manufacturers know about this problem. They have issued service bulletins that cover adding a filter inside the tank to cure fuel-pump RFI. Ford, for example, has published a bulletin, appended to the end of this message.

In the Ford TSB, the filter is installed inside the gas tank, with series inductors and parallel capacitors for each lead. Ford does not offer that this technique will work on any other vehicles.

If you have a fuel-pump noise problem, the place to start is with your dealer or automotive service person. They can determine if there are any service bulletins that apply to your car. This is especially true if your car is out of warranty. In all cases, all work on vehicles should be done by people who are qualified to do the work and who are familiar with the vehicle.

The ideal place to install the filter is right at the pump, which is inside the fuel tank. It is electrically possible to install the filter on the leads where they enter the tank, but if the tank is not well shielded, electrical noise could still be radiated by the leads between the filter and the motor. On lower HF, however, this radiation will be minimal and it may be possible for your dealer to install filters to the wires external to the gas tank.

Hams have reported various degrees of success using various filtering techniques. In some cases, ferrite inductors have been added to both wires feeding the fuel pump. It is usually more effective to use a separate choke for each wire. In general, at upper HF, one of the split bead types can be used, with a couple of turns of wire on each bead. At lower HF, it will be necessary to use a ferrite toroidal core, perhaps an FT-140-43, with at least 10 turns of wire. In addition, it may be necessary to try a 0.01 uF capacitor across the two wires, perhaps on each side of the chokes. Some have reported good results using just the capacitors. There are also mechanical considerations, too. Splicing wires can result in mechanical failure, or corrosion, with the result being a motor that will not run (these things seem to happen at the worst possible times!). In addition, heavy chokes or capacitors can vibrate as the vehicle goes over bumps, ultimately causing the wire to fail.

One last possible solution may involve replacing the fuel pump motor with an aftermarket electric fuel pump. The aftermarket pump may be less noisy and it may be easier to add the appropriate filtering to the external wires. These aftermarket pumps are usually installed external

to the gas tank. It will still be necessary to remove the in-tank fuel pump, but once this is done, the external pump can be easily maintained. Your auto parts supplier should be consulted to determine which ones can be used in your car. Unfortunately, ARRL doesnï¿½t have any information about which ones are electrically quiet.

ARRL also wants to stress that any cure should be applied only by qualified repair personnel; gas tanks are not places for the backyard mechanic.

The following is the text from Ford's TSB 98-7-3. The ARRL has received a report that TSB 99-12-9 covers up to the 1999
model years.

Ref: Ford Technical Service Bulletin: 98-7-3
ï¿½Fuel system - fuel pump: whining/buzzing noise comes thru 2-way radio speakersï¿½

Vehicles covered:
Ford
1990-93 Tempo
1990-97 Probe, Thunderbird
1990-98 Escort, Taurus
1990-99 Crown Victoria, Mustang
1997-98 Contour

Lincoln-Mercury
1990-92 Mark VII
1990-93 Topaz
1990-96 Continental
1990-97 Cougar
1990-98 Sable, Town Car
1990-99 Grand Marquis
1991-98 Tracer
1997-98 Mystique
1997-98 Mark VIII

Light Truck
1990 Bronco II
1990-96 Bronco
1990-97 Aerostar, F Super Duty, F-250 HD, F-350
1990-98 Econoline
1990-99 F-150, F-250 LD, Ranger

1991-98 Explorer
1993-98 Villager
1997-98 Expedition, Mountaineer, Windstar
1998 Navigator

The Problem:
Electrical noise on radio speakers caused by in-tank electric fuel pump.

The Fix:
Installation of an RFI filter (Part No. F1PZ-18B925-A) on the fuel pump inside the fuel tank. *Note: some light trucks may require one RFI on each fuel pump on multi-tank vehicles.

Test Procedure:
Fuel pump radio noise is relatively constant and changes only slightly with vehicle speed. If the frequency of the noise varies, or the noise comes and goes with vehicle speed, then it is NOT the fuel pump, and this fix will not be effective. Use the following procedure to determine if the fuel pump is the cause of the radio noise.
1. Turn the radio on.
2. Turn the ignition key to the RUN position, but do NOT start the engine.
3. The fuel pump should run for about 1 second with the key in the RUN position with the engine not running. Listen for noise in the radio. If the noise is present while the pump is running, and stops when the pump stops, then the noise is being generated by the pump and this procedure should help.

Additional information from the Web site at http://www.4x4central.com/tips.htm#rfi points to Service Bulletin #9117-5 and the Ford "Filter Kit," Ford Part # E7PZ9B357A. There could be other service bulletins for other Ford models. If anyone has updated or additional information, send it to the ARRL RFI Desk at rfi@arrl.org.

Radio Frequency Interference

Anyone using a ham radio or C.B. in their Explorer has most likely heard the effects of RFI. The interference sounds like a high ambient noise level and the reciever possibly shows many S-units of signal strength even when there is no one transmitting. The in-tank mounted electric fuel pump is the source of this problem.

Fortunately Ford has a fix for this problem which is covered under the original warranty. If the truck is out of warranty you can get the parts and do the job yourself or have it performed at a shop. The Service Bulletin that covers this problem is # 9117-5. The part you need is a Filter Kit, Ford Part # E7PZ9B357A.

Although the addition of the filter did cure about 90% of the problem some interference is still noticeable on a few of the Ham Radio bands. Even so, it sure sounds much better then before the fix.

Putting a cap on the power line is a fine idea if the noise is coming in on the power wiring.
The trouble is, the cap on the power wiring won't do any good if the noise is coming in through the antenna.
How can you tell if the noise is coming in through the antenna or the power wiring? Start the engine.
Listen to the noise. Disconnect the antenna at the back of the radio. If the noise is gone with the antenna disconnected, the noise is coming in through the antenna. If the noise is still there when the antenna is disconnected, the noise is coming in on the power wiring. Remember to reconnect the antenna when this test is finished. If the noise is coming in to the radio on the power wiring, then the cap on the power wiring may work. If the noise is coming in through the antenna, the noise will have to be suppressed at the noise source.
Good Luck, John

And where in my post did I make any mention of completely dropping code?
I was mearly stating that it makes little sense to require ADDITIONAL
code tests (above the initial 5 WPM) to gain greater phone privileges.

The international treaty is only a formality. It, like the FORMER FCC
rules, were written long ago. I predict that the morse requirement will
be dropped by the ITU at a future conference. Then the FCC will be free
to drop the code requirement completely.

Dave

> best place to get it? Thanks for any help.

If you have an interference problem, start by installing a low-pass transmit filter. This will ensure that your transmitter is not transmitting harmonics or other spurious emissions that might interfere with over-the-air television.

You might also have problems with your fundamental signal overloading nearby TVs. You may be able to cure that with a high-pass filter. In addition, in some cases you may also need a common-mode choke. You can make a common-mode choke by wrapping about 10 turns of the TV's feedline onto an F-240-43 ferrite core. One is available from Palomar Engineers (different Palomar. :-)) See:

http://www.arrl.org/cgi-bin/tisfind?patt=Palomar

In real stubborn TVI cases, you may need to install a common-mode choke on the AC line, or an AC-line filter, such as Radio Shack catalog # 15-1111.

Interference to cable TV is not generally caused by transmitter harmonics. To cure CATVI, try the above cures, but without the high-pass filter. A high-pass filter in a cable system can interfere with the communication between the cable set-top converter and the main office. The result can be a disconnect. For cable ready TVs, you can try a high-pass filter, but it is usually not needed.

Interference to non-radio devices, such as telephones, computers, stereos, alarm systems, etc, is not caused by transmitter harmonics. The cure must be applied to the affected device.

For telephone interfernece, try one of the Radio Shack telephone interference filters. For 11-meter operation, a 2nd filter may be required for the handset. Radio Shack does not sell those, but you can buy them from K-Com electronics. See http://www.arrl.org/cgi-bin/tisfind?patt=K-Com. If the phone (or phone device) has an AC power connection, make a common-mode choke for the telephone power wire, using an F-140-43 ferrite core.

For more info about various RFI probems, see http://www.arrl.org/tis/info/rfigen.html. See also the ARRL RFI Book, http://www.arrl.org/catalog/6834. The ARRL company/product database can be seen at:

knowing CW (Code) is important even on CB.
5 words a minute should be sufficient, and isn't that hard to learn.

My Wife and I both know Cw......as long as it;s slow! it really helped one night on the CB.

The Car Broke down, right in the middle of talking to my wife, the Microphone element went dead. She did not know my Location (QTH, for you amateurs):-)

I started sending CW (am carrier) by patting the microphone key. My wife heard it. and switched the base over to sideband to recieve. I did the same.

We was able to communicate even though my 148 GTL had no modulation.

oh, yeah, I could have had a cell phone, called from a house, or a host of other things
But, in this unsettling world, learning something like CW, might save your life sometime. I like to have aces in my pocket
Think about this.
have you ever heard someone talking on the CB with a roger beep? you can hear that roger beep a LOT further than the voice. same with CW.

If you have to radio for help, lots of electronic devices will throw a carrier. think about it.

But if I need help, and send CW, will anyone be able to read my message?

My 2 cents.

The book is out of print, originally published by Varian Eimac. You can find a partial copy of it on the Eimac web site. It's all the really serious meat and potatoes about power grid tubes. If you plan on comming up to speed, I would recomend some of the projects in 70's/80's vintage ARRL Handbooks. The stuff in Care and Feeding will probably come off as very dry...
If you have specific questions, feel free to drop me a note. I'll try to help where I can.

Phil,

His first name is Rich...

You can read the entire article on the eimac pages.

It is quite outdated, though. Your better off reading the radio handbook by
Billy Orr.... He worked as a D.E. for Eimac.

Jay your the man!

I got your mail today. I think that my HY-Gain Penetrator 500 antenna
is the 199 1/8" one(801090 23ch model) :-(
Funny though I measured almost 200" from tip to the top of the 1 1/4
base tubing. Also if I add 200" to 71"(base tube) I get, pretty much
271" which is 22.6 feet

I did this real quick. I will need to measure all elements but what if
this model is one of the other 2 models you don't have? you said there
were 5 models...
Hmmmm

I am new to using a cb. I have had it for about 4 months. Its just a cobra
10 but i wasn't really aware that CB users could get on with ham operators.
What CB channels are used by the Ham operators?
Thanks alot.

Matt Briskey

No.

What it means is that you better make damn sure that when using any type of voltage based wattmeter you better use a single tone sinewave with a peak reading meter, and for accuracy, don't exceed 100 percent modulation.

'Cause a iffin ya do, you ain't a measurin' a nutin but bullshit and gettin' wrong readins!!

Not me... Bejler maybe. I had my bad battery episode 3 months ago.
I have 2 vehicles, 2 cb setups, and 2 insurance payments. I've
learned how to check a battery, clean the terminals on a regular
basis, and I have distilled water to add to my batteries. <:

The battery that died would show full voltage for 3 minutes after
turning off the motor. Then it would rapidly drop about 2 volts.
I decided it had a shorted cell before I read on a web page what
the voltage is with a shorted cell. About 10.85.

> I was mearly stating that it makes little sense to require ADDITIONAL
> code tests (above the initial 5 WPM) to gain greater phone privileges.

I agree, I have said ever since the code vs no-code debate started years
ago that the WPM requirement for all classes should be dropped to some
reasonable level.

> The international treaty is only a formality. It, like the FORMER FCC

Again I agree that the ITU will eventually drop the code requirement,
but until they do the code requirement will remain.

And if the businesses like power companies hadn't put the time and effort into fixing the problem, you would be sitting in the dark wondering why it was cold and your computer wouldn't boot.

The phone companies were pretty much immune.. the switches run on Unix, and that won't break for another 30 years or so.. (that's when there will be an interesting gotcha as their file systems break...)

: $125.00 or like Toll stated drop 572b's in and these tubes will last forever at
: 1500 plate volts. 1200.....

You might ask ameritron why they bother to neutralize an amplifier that normally doesn't need it. Yes, Svetlana announced they will discontinue their 811a production soon.

If you drop in 572b tubes, you should adjust the bias for the proper zsac, otherwise your signals gonna be less than perfect.

Also note the Ameritron ads in Radio Magazines that boast vertical mounting. It's a bunch of crap... There have been very very few problems reported with quad sets of 811a's mounted in the Collins 30L-1. Mine still preforms like new.

I think if your radio is drawing more current than the factory wires can handle you are asking for trouble because nothing else in the radio is designed to handle that much current either. That being said in desperation I have made plugs by finding a couple of Molex pins that will fit the radio and casting a plug to fit in acrylic resin. You could also replace the complete power connection on the radio.

Source record: 18165

: Phoneman <phoneman01@hotmail.com> wrote:
: Does anyone know what step or steps are necessary to convert a Siltronix
: 1011D to transmit on CB??

There are three ways to get a siltronix to transmit on 11 meters.

The first two are hack methods.

1) change the capacitor/coils in the vfo (don't do it)

2) twist every adjustment in the vfo section, then top it off by moving the carrier oscillator caps so your radio will never sound good (don't do it).

3) Enable transmit on the lower band switch position with a wire. If you Email me direct, I'll tell you how to do it.

Siltronix Rules...

1) Let absolutely no-one align your Siltronix radio unless there's already a real problem which makes it unusable. Then specificly limit "the tech" to doing what needs to be done to get the radio back to normal operation.

2) I know only three people who can properly modify a Siltronix VFO Band Segment move without hosing up the stability. Don't let anyone inside your VFO compartment for any reason. Even the transmit enable mod doesn't require you get in the vfo box.

3) Allow it at least 15 min warmup from a cold start turn-on. Turn it off when you don't want to use it.

4) Put a small low speed boxer fan over the final section, sucking air out.

5) Run the radio max 35 watts am unless you like to buy 8950's nos.

6) Set the bias on a working radio after a min 1 hour warmup.

I'd rather help you keep your Siltronix working properly vs some hack chewing up your fine radio. I have a few 1011's myself that work very well. I've lot's of experience inside them and I even knew about the guy who designed them. I've been servicing them for many many years.

So Email me if you have questions, I'll try to help you along... no charge.
cheers

The neatest story I heard about CW refereed to a man who was very sick in the hospital unable to speak. The story went something like...he only had energy to pickup a finger, and that's what he did.

He tapped Morse code on his wives hand and then she would reply back on his hand. I read about it somewhere and though it was cool.

However I have not learned the code. I think CW is neat but I don't see it as vital.

You said that you switched to ssb, how do you send CW on ssb?

Nothing against CW, but I think a cell phone is a better plan for emergencies.

The 102 inch antenna will not be as broad banded as you are expecting or
hoping. It should be more broadbanded than a loaded antenna.

320. Re: Amateur Restructuring Announcement - FCC screws Ham Radio!

> threatening its existance!!

Then it's all over but the shouting. Because both alternatives lead to the death of ham radio.

1) Too few hams = no political power = bands get taken away for lack of usage.

2) Easy test/no code = People who have no committment and who come and go at the drop of a hat, mostly going. No sense of membership in anything, no sense of anything at all.

How do you explain ham radio to others, in an age where you can chat with people all over the world in IRC? I can call CQ by opening an IRC channel for any interest I have, and see who responds. From anywhere in the world, really.

And hey, if IRC is too difficult, I can just load AOL Instant Messenger, and do a search for people who are on, for any interest. You show that to hams in the 1950's, and even then you'd see how many would switch to this.

If there's little effort, then there's no sense of pride or of belonging to a community. And you can kiss it all goodbye. People will just use AOL IM, not "unreliable" ham radio.

322. Galaxy DX88 problem

Newsgroup: rec.radio.cb
Date: 2000-01-04 00:00:00 UTC
From: cbdxer@aol.com
Message-ID: <20000103221709.13858.00000195@ng-fj1.aol.com>
Source record: 18171

Seems my PLL chip keeps blowing out in my DX88. Not sure what the problem is. Everytime it is fixed, It will work for a couple of days. Then I will be driving along and notice the freq. change. Any suggestions on what may be causing this problem. The radio is mounted under the console in a F350 crew cab with a power stroke diesel. Thanks.

323. Re: engine noise

Source record: 18172

Greetings!

Try http://www.iserv.net/~codyspc/engine1.htm - it's a little test to
help you figure out the noise, and suggestions on what you can do to
remove, or at least, lessen, the effects.

Hope it helps...

While Dancing with the Mouse on Sun, 2 Jan 2000 19:00:22 -0500, the
Modem interrupted with an MNI from ""Patrick" <Brochet@netscape.net>",
and the MotherBoard buffered this to Video RAM:

You're right, it is pretty easy to do channels in the Grant XL. I have one, and I love it. It's a little more than what I can say over the internet. But, I can mail you information, if you like. I can also get some modulation swing kits that will make your a.m. super loud.
If you are interested, e-mail me.

Message-ID: <38716b62.258178229@news.iserv.net>
Source record: 18174

Greetings!

There were two versions of this board that I've come across, one older one uses a 10 ohm resistor with a ferrite bead on the lead that goes into the board.

Another uses a 100 ohm resistor and no bead.

Since you didn't specify - I'm taking a wild guess that you need the 100 ohm resistor.

While Dancing with the Mouse on Mon, 03 Jan 2000 21:14:59 GMT, the Modem interrupted with an MNI from ""Richard L. Bassett" <whitenite@adelphia.net>", and the MotherBoard buffered this to Video RAM:

From: CodysPC@Iserve.Net
Message-ID: <38716932.257618385@news.iserv.net>
Source record: 18175

Greetings!

I had posted a series of mods to correct a problem with the audio chip in one of the CB tricks Email forums, It may still be around in someones archive.

For starters - remove Q202. It's the limiter and partly due to it's bias, the cause of some RF leakage into the audio section by IC202 [audio amp] - Q202 is located by RV202.

Locate C242 and C238, and look on the bottom, or foil side of the board. Note the ground trace. One of these caps is left unconnected due to an error in the photomasking and etching. Must have been a hair or two on the mask during mass-production of the copies to make the boards. Just solder the open end of C238 [ground side] to the ground of C242 - a solder bridge works.

Reassemble case, and enjoy the radio!

While Dancing with the Mouse on Mon, 03 Jan 2000 05:33:36 GMT, the Modem interrupted with an MNI from "Tom Rowan <"trowan"@bellatlantic.net , webmaster@NorthBergenPD.com>", and the MotherBoard buffered this to Video RAM:

For this type of noise, I've found that one of them batteries with both types of terminals is best. I run the car off of one set and then the radio gear off the other. To my knowledge, there is no better way of suppressing electrical noise coming in via the power leads.

grant xl's do not come with 120 channels. They have 40 AM, 40 USB, 40 LSB. The box will say they have 120 channels of which they do! But not 120 strait AM channels. This is called market strategy to help sell their radios. Unless I fell asleep for a year or soI have never seen one come with uppers and lowers.

Source record: 18181

I wish it could be possible for everyone to just 'get along', it would make things a lot easier. But being a HAM myself, and starting from CB, I can understand most people's complaints.
I had a very hard start in amatuer radio, learning procedure, and proper operation. I had to listen to the local two meter repeater for months before I became proficient. On the ten meter band, I still don't know what those guys are saying. Most HAMS don't have the time or the patience to help a beginner. And I'm sure, like myself, many new HAMS lose interest and resort back to CB; a more user-friendly, talk-to-everybody, radio. The proof in this, is the new change in licensing (HAM radio is dying), HAMS need to lose their superiority complex.
I'm not referring to all HAMS in general, just those that think they are better than a CBer. Only because they know more.
As stated before, I still believe that everyone should try and get along, and talk or at least help the new people. I do.

>> Now, if there aren't increased numbers of hams, I would expect that more ham
>> radio frequencies to be lost to commercial services

That doesn't make sense. The only frequencies in danger of being lost
are those in the V/UHF region. There has been a code-free license
available for that portion of the spectrum. Are you saying that that
code-free VHF+ license has been a failure?

How will lowering the HF code speeds provide any more protection to V/UHF?

Our HF frequencies are in no danger of being auctioned; in fact, as
we speak, proposals exist at the government level to give hams even
more HF spectrum.

>1) Too few hams = no political power = bands get taken away for lack of
>usage.

And who is going to take away our HF spectrum? If anything, we stand
to gain more in the near future. (We were given three new HF bands during
the 80s decade.)

>How do you explain ham radio to others, in an age where you can chat with
>people all over the world in IRC? I can call CQ by opening an IRC channel
>for any interest I have, and see who responds. From anywhere in the world,
>really.

If you don't mind being dependent upon millions of miles of phone lines
and government- and corporate-owned Internet computers.

There is no such dependence in amateur radio.

Jeff

I show measurable voltage drop on a strong 2 pill with 10' - 12' of 8 gauge
on it. 8 gauge at the minimum for a 2 X 2879 box if you want to see decent
numbers out of it. 10 gauge would definitely be choking that type of amp if
hitting it with a decent radio and a going into a good antenna system. Sean

Right on Boo. Most of the "modified" amps that i see are actually running horrible. Out of phase, parasitic oscillation, horribly non-linear with tons of cross-over distortion, etc... It all looks like "big numbers" on a cheap wattmeter though. This is how the guy showing 400 watts just keyed on the guy showing 1000 watts. One of them is real "on the band" power and the other is strictly an RF GARBAGE producer.

There is NOTHING that should be done to the Texas amps (other than adding heavier wiring and installing some type of fan) unless your very familiar with how they work. If you have to ask, you shouldn't be doing it unless you've got money to burn. That's exactly why i didn't go into details on the previous post. Very good design to start with. If you see a BIG numbers increase by doing very simple mods, you've just added a bunch of sludge to your signal. Just keep in mind that they DO NOT like a high carrier level into them, even if they do say "hi drive" or "HDV" on them.
Sean
>

-=PEAKABOO=- wrote in message <84os4afhs1@nntp3.atl.mindspring.net>...
Why does everyone believe that there is a "super" mod for the Texas stars? The amplifier is generally well designed from the factory for the most part up to the 400, the 500, if driven needs some power wire upgrades amongst other things, but the other things I am referring to are really not to be attempted by someone who needs to ask the question of how to mod a texas star in the first place, as far as the smaller amps (up to the 350) are concerned I personally would get rid of the fuse that comes with the amp, it will only do you good in a reverse polarity situation. If the amp ever draws enough current to pop the fuse Then there is a good chance the parts inside do not need to be saved anyway, and the fuse is a very week link in these smaller amps, usually melting or corroding or both. Leave the amp the way it is, because there is a good chance that it is as clean and stable as you are going to get it, just because you see more watts on a dosy meter does not always make it better.

Hello Toll,
>His first name is Rich...
Yes, I know.

I recently sent for some of his parasitic suppressers for a friends
Kenwood TL922.

It was not me that posted the original post. I was just trying to help
him locate that book and had remembered Rich mentioning it on his site.

I can also recommend Rich's web site for anyone interested in reading up
on the shortfalls of many a commercial amp!

Keying the microphone on sideband would not send out a carrier for
your wife to have heard. A nice story, Tempola, but you might want to
adjust the fine details before you tell it to someone else.

Besides, its also a little hard to believe that both your car and your
microphone went dead at exactly the same time - not impossible, but darn
rare if your radio equipment is any good

You did sign your message with the words, "Hillbilly's CB Shop."
Perhaps you should find a better shop that sells a more reliable
microphone. Or is that the best shop you can find in Missouri? ;-)

Matt, many ham operators also own CB radio equipment, and talk on the
CB channels. One reason we might do this is to talk to our friends that
don't have a ham radio license.

You usually cannot tell who is a ham operator on the CB channels
because we use "handles" just like the rest of the CB'ers (we usually
don't use our ham radio callsigns on the CB channels).

However, if you ask around on the radio, I'm sure you'll find several
ham operators active on the CB frequencies in your home town.

> complex.

Look, KC2DWA, don't let all those procedures prevent you from enjoying
ham radio. Ham radio operation is an evolving art, not a fixed science.
Most of those procedures evolved into what they are today - many of
them didn't exist twenty years ago.

They evolved because the newcomers twenty years ago were more
interested in communications than they were with existing procedure -
they slowly changed the procedures into something that was more
comfortable to them (the procedures of today). The newcomers of today
will eventually make ham radio evolve into something entirely different
than it is today - something that is more comfortable to them.

In other words, don't worry about breaking a few of those procedures -
life will go on for both you and ham radio. Just try your best, and to
heck with those people who are stuck on procedure - there are plenty of
others to talk with.

I'm not suggesting that you ignore all the procedures - most of them
are helpful. I'm just saying that you should not get so stuck on
procedure that the procedures prevent you from enjoying this hobby.

Let me see if I got this correct......

The sender wants me to open a file.

The sender is unknown to me, and clearly indicates in his address that he is "bogus".

The sender does not allow incoming e-mail.

Should I do it? Naw.....think I'll pass. Old "Charlie" may have a STD........

Besides, anyone from "bogus.net" probably has very little accurate information about the FCC.

I think you both are wrong. The blame needs to be placed here in
the amateur community. Not much impute from the ARS concerning the
changing of the ARS license system. The FCC read the impute given
them and realized that the 'majority' wanted to dumb down ham radio.

In an attempt to prevent loss of sales the big three (3)
Icom, Kenwood and Yeasu agreed that the new radios
produced this year will be more geared towards the
New License Class. Xtra Class CBer the features will include.

Super Bad Antenna Tuner will tune V5/8, Antrons, Wilsons,Jo-Gunns to any band
Memory Channel (1)=27.1850
10kc switch/Unlocked Clarifer
H/M/L power switch
Echo with voice disguiser.(For the 3.950 Crowd)
Roger Beep
Additional Slots for noise toys (No Filters)
Anolog Meter (SWANG)
Easy to read frequency chart A+16=14.313
Free subscription to Secret CB,Master Edition Tune Up Manual.
So even the newest ham can tweek and peak,
Let me see if I cut out the ALC on my 746, it will dead key 1watt
and swang 225, WHEW!!! got my 2950 beat by 3watts according to my dozy.
Oh I almost forgot. An extra antenna connection for my Wilson 1000
and the all important 610 included with the rig.

Ten-Tec is still undecided.
Just a little humor amongst all the turmoil.

73 all Donnie
N4JZH (General Class Operator) Legit!!

Greetings!

It provides DC ground for bias to the transistor.

The resistor takes care of the DC side, and the ferrite bead reduces
RF into the resistor. RF produced goes to the transistor and in turn
the resistor provides the DC bias.

If you accidentally short out the transistor, or run a high match,
this could cause the resistor to sink a lot of DC current. The
resistor acts like a cushion and a "generic" impedance matching
circuit. If it goes out, it opens like a fuse. You'll lose power due
to the bias that the transistor needs, is no longer there.

It also keeps the transistor in high SWR cases, from self-destructing.

Don't try too many mods with this section, it's a tricky one to get
this section to work right and keep out of phones, TV's, VCRs' -
e&c...

Hope this helps...

IMHO the "unreliable" aspect of ham radio is what makes it challenging
and fun. How much fun would working a distant country be over the
internet be, knowing full well that there's nothing to prevent it? What
would be the point?

The internet is TOO easy. Pretty soon it will become a cesspool of
sludge for every low-life, social deviate, that can't even get a date,
much less have a life outside of their homes. It will become
increasingly difficult to find meaningful, intelligent, and mature
people to communicate with. This may end up being the savior of ham

radio.

Dave

Sigh. With all the capabilities, services, and potential benefits that
the internet has the capability to provide, some people still see it
only as a way to a cheap thrill.

No matter how "good" the internet gets, it'll never replace the real
thing.....

Gee whiz, I interpreted it as the mobile transmitting a carrier in the AM mode while the Base station received it in the SSB mode, and visa versa. This is correct. Maybe you need hit the books a little harder, will help ya out some.

> Besides, its also a little hard to believe that both your car and your

No it's not hard to believe. Ever half to replace battiers in a flashlight just when ya need a flashlight? Your statement sure sounds like a arm chair, no hands on, no experience, with electronic equipment background.

What a snotty and unfriendly thing to say. I bet ya you wouldn't say that to the man's face.Your snotty and unfriendly ways sure are a deterrent to attracting new people to amateur radio. Maybe the FCC should have restructured the licensing requirements to only allow friendly people into amateur radio?

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the road ah ways from the fillin station.

Because the 1000uf capacitor has so much internal inductance that it's
impedence at RF frequencies is actually higher than the 1000pF capacitor,
probably by three or four orders of magnitude.

Source record: 18216
Cross-posted to: rec.radio.amateur.equipment,rec.radio.cb,rec.radio.swap

FS: Superstar 3000, AM/SSB/CW ham radio. This radio covers 3 bands: the standard 40 CB channels , high-CB channels 40 to 80, and the 10-meter band 28.500 to 28.995

Bands can be easily moved around within this range by changing a crystal (there is one crystal per band to be changed)

It has the ability to be shifted +/- 7 kHz around the channel center which creates a continuous coverage across the bands

The radio was not modified in any way, it came with the current frequency arrangement from the factory

Radio has never been used mobile, looks and works very good

No manual and mobile bracket included, sorry

Exactly, there was a time when being able to communicate all over the world using your own shortwave equipment was a fascinating thing, today anyone can pull a cell phone out of their pocket and call almost anyone anywhere in the world. Most people don't ever know what ham radio is (or think it is cb radio) and could not care less.

371. Cam89 problem

Newsgroup: rec.radio.cb
Date: 2000-01-04 00:00:00 UTC
From: Joe Ann <japartin@corridor.net>
Message-ID: <s74b4ki15k241@corp.supernews.com>
Source record: 18220

Hi, and Happy New Year,

My brother recently purchased (via Yahoo) an old Cam89 which has the singular problem of a hum or buzz during transmit. I have been unable to figure a cure and was hoping a CB guru might point out a simple solution. Consider the following: 1)the radio hums only during transmit; it receives fine without any hum, 2)when transmitting, it kicks a carrier, and even modulates, but everything competes with the loud hum, 3) am using a good, known mic, so the mic's not the problem, 4) the radio appears clean with no signs of modification, 5) this is a pre-PLL design with 12 crystals for synthesis, 6)have checked the mic socket on the radio,tested fine, went ahead and re-soldered since the connection looked somewhat poor, 7) temporarily "piggybacked" a large electrolytic onto the main cap in the power supply, didn't help, 8) have checked for loose connections/poor grounding, have found none.

Everything else about the radio works fine. Hope there's something simple I'm missing.

TIA,
Nolan

Hello Patrick: I take it your trying to reduce the engines initiation noise, or alternator noise, you didn't say which.

Ignition noise is a popping type of noise, and alternator noise is a kind of wine type of noise. There is also noise that comes from the fuel pump, and vehicles engine computer, I know how wonderful!

Ed W1RFI had a great suggestion, on the ARRL web site for interference. The material in these books talks all about the auto motive interference problems. The web site is at:

http://www.arrl.org/tis/info/rfiignit.html

Another great book is "Interference Handbook" by William Orr, available at 1-800-287-8477 for $13.95 plus shipping.

One good place to place to look for ignition noise problems is the noise suppression capacitor at the coil, make sure its connected and its good. There only a few dollars to replace.

Who said anything about being correct? My message had nothing to do with the "popular" view. The fact is, it is the most widely accepted whether its wrong or not. And I don't think I'm being some kind of drone for thinking that way. Once again, I think you were one of those people who missed the entire theme and intention of my message. Did you not read the following:

>I was just trying to say that I
>wished everyone "good luck" (even though I don't believe in luck) because
>many of us were a little tense about the Y2K bug. Plus, I was just hoping
>everything would be ok with the internet so we could all come back here to
>post our great messages.

You didn't seem to address that issue. I think perhaps you are looking for a debate. A simple "thank you and I wish you 'good luck' too" would have sufficed. I mean, come on - everyone can debate about the actual start of the millennium 'til the cows come home. Just read some of the other replies (I'm not questioning your intelligence. You are probably a very smart guy.). But, that simply wasn't my point. Did you even get my point?

> Rafterman

1. The wire must be sufficient to handle the rf current involved. up to
a kilowat or so #14 or larger is fine
2. Aluminum or copper makes no difference. Aluminum will corrode and
cannot be soldered. I use copper
3. rf currents flow on the outside of the conductor so stranded may have
slightly more surface area than solid of the same guage but in
practice either will work fine.
4. the distance does matter. keep it as short as possible. what is
"ground" to DC is not necessarily ground at rf.
5. in practice 6' is probably adequate however, the required groung rod
length is a function of the ground conductivity. the better the
conductivity the shorter the ground rod can be. some installations
use multiple ground rods.

hope that helps, Dan

377. can a cb tech work on a simple scanner????

Sorry Dwight, but the story would be right. He didn't say he keyed
the mobile in SSB, only that she received in SSB.

If you reread the story, you'll see that it's quite possible that
the situation would work. He specifically stated he sent an
AM carrier, and his wife went SSB to receive him. And
implied they 'switched' to go the other way.

Hope it's not a little bit of that 'ham superiority' showing...

Mike

Well, I have used my computer to TALK to a guy in Austrailia and another in Rome (and countless others in the US).

When I say talk, I mean talk - not type. Works EXACTALLY like any rig. Talk - listen - talk. OR, if you have a full duplex sound card on both ends, you can use it just like a telephone.

as far as I can tell it (The internet)has already turned into an unreliable cesspool.Half the "Information" is outright false and the other half you just aren't sure about!
I agree that the fun in radio is the unexpected opening of bands and getting that special contact.
I have never nor will be a "Ham" ,but I have been DXing for 20 of my 35 years and I still have to rely on the weather and propogation to get some unique loggings.

Dear NG subscribers,

I am a CB enthusiast, though a rank novice in comparison to many here who are way technically proficient. I can tune an antenna, set a low SWR, and operate a soldering iron, but opening a chassis may be out of my realm. However, I've been bitten by the bug so want to learn more.

After reading Yrac's post from 1/2/00, I believe I've come to the right place. With his post in mind, I hope some of you can answer the following questions to help bring me up to speed. (Now remember, some of us are new so I know these questions are obvious to you, but I'm just getting my feet wet.) I'm not too worried about specifics like which antenna is "best" or receiver is "best" since we all have personal opinions. Rather, I'd like to know more about some of the bigger concepts and where to find resources on the web.

1. Even I know amps are illegal. Yet how come so many are apparently running them? How do they (you?) not get caught? I've heard from several truckers of the "stings" the FCC runs at roadsides periodically, but it seems as though many flaunt huge wattage anyway. What gives?

2. Since an amp may be easy to run, is it worthwhile? Should I get one and how strong?

3. What about power mics? Are they neccessary? Do they really make that big of a difference?

4. What exactly do people mean when they refer to "DX." I see "DXing" and "DXer's" etc., but what are they talking about?

5. In the past, I had a radio tuned at a CB shop while I was traveling. The power was not increased, but it did perform better with less static etc. I now live in a small town with no CB shops. Are there any good places I can find on the Web to send in my units for servicing/tuning and so forth?

6. I have tracked down the significant source of noise in my vehicle to the fuel pump. Does anyone know of the best fix for a '93 Suzuki Sidekick, fuel injection? The local Chevy/Geo (Sidekick is a Geo Tracker) is clueless. Help. (BTW, both antenna and radio chassis are grounded. Through testing, I've ruled out plugs/wires/distributor. The noise comes on when the pump pressurizes, then stops, and returns when the engine is started.)

7. Regarding modifications, I've been to several sites with such info. However, I'm still confused. First, I haven't been able to locate mods for my radio(s). Specifically, I have a Midland 77-115 and a realistic TRC-484 (O.K., stop giggling everyone!) One site did list some numbers for these models, V7 or VR-5 or something like that, but made no mention of what these

meant or what to do. Second, How much would mods cost? Would it be better to just buy a new radio? (My wife won't let me spend any more on toys.)

Thanks so much for your help. I hope to learn more and maybe catch some of you on the airwaves!

New Guy

Source record: 18249

I am glad that CW is important, but it may not be neccessary. In this particular instance it was a good thing, even if they were using a chart to send and recieve. This argument still fails to prove that it should be mandatory. I plan on learning to pass the test for my ham license upgrade, and then get on the air and learn to be more proficient through use.

>switched the base over to
>> > > sideband to recieve. I did the same.
>> > >

If the sender used AM and the reciever used SSB it would work for all those nay-sayers who say it couldn't.

Dan Bryden stated:

>1. The wire must be sufficient to handle the rf current involved. up to
>a kilowat or so #14 or larger is fine

That is some mighty thin wire. And then you state the following statement:

>3. rf currents flow on the outside of the conductor so stranded may have
>slightly more surface area than solid of the same guage but in
>practice either will work fine.

The larger the wire the better! Just keep it within reason. 6 or 8 guage stranded should be a minimum and remember that the lower the # the thicker the wire.

Hey Loek,
You should be nicer. Your picture saves me from opening my new in the box radio to photograph it. Yes, it looks the same....maybe mine is even
better condition!

First, your photo is not copy righted anywhere that I can tell. Second, accusations of false auction imply slander, which is a jailable offense in the USA. Third, dont you have something better to do with TI's money than to waste time on email like this to the newsgroup in duplicate? Maybe I should report employee A0927429 to the IMS/TIORL police...or
worse, to all my TI buddies in Forest Lane, Lewisville, and Spring Creek!
Lighten up, and happy new year. Oh yea, for auction. One great Uniden HR-2510 in the box. Or, buy Loek d'Hont's if you dont like auctions. Choice is yours, folks.

thanks,
Joe K7JOE

For real. Who the hell ever heard of a "Loek d'Hont". And how could Loek buy a HR2510 six months ago when they have been out of production for years? I say Loek stole his picture to begin with. K7JOE is the one to buy from, not the Texan with the fake name and story.

409. Re: Amateur Restructuring Announcement - FCC screws Ham Radio!

Newsgroup: rec.radio.cb
Date: 2000-01-04 00:00:00 UTC
From: bill carty <bcarty1@compuserve.com>

This debate is interesting. I am a ham radio operator, have been since the adoption of the no code tech license. I had tried for years and years to study code and could never quite get it. This is listening to the code tapes for several weeks before giving it up each time as it wasn't sinking in. This was also using computer program that taught it too. What I think is missing is not that the Code is going away. (oh by the way in the mid 1990 us coast guard stations no longer required their station to have a CW qualified operator on the radio, as commercial high seas ships are no longer required to have a CW qualified radio operator on board). What everyone should be focusing on is the theory! I haven't picked up a study exam since I got my license a few years back, but some of the theory required to pass the test is simple, and yet, I couldn't build a radio from what I learned in the study text. The technology has changed to the point that many hams can not repair even a simple antenna connection on their radios.

Between surface mount technologies, digital circuits that process radio signals into audio. Circuit boards the size of a small deck of cards the examine text doesn't come anywhere near allowing a newly licensed ham to work on his own gear.

We should be worrying about a dinosaur like the code, but how to make the examinations reflect reality and what is really going on in the real world.

A quick question to those of you bemoaning the loss of the code, can any of you build a 20 amp power supply to power your mobile radio?

Think it through. This is one of the most fundamental things we do as a ham operator, power our equipment. With out power, no radio transmission.

Okay off my soap box....almost....Those who want to get back to eaves dropping, and who think this conversation/discussion is inappropriate here, should think about the fact that many ham radio operator got their start listening to both short wave, and scanner, listening to hams, and others on their equipment.

Greetings!

I'll answer with my own opinions IMO = Disclaimer.

While Dancing with the Mouse on Tue, 4 Jan 2000 14:00:49 -0700, the
Modem interrupted with an MNI from ""Skimickey"
<skimickey@bewellnet.com>", and the MotherBoard buffered this to Video
RAM:

:+> Dear NG subscribers,
:+>
:+> 1. Even I know amps are illegal. Yet how come so many are apparently
:+> running them? How do they (you?) not get caught? I've heard from
:+> several truckers of the "stings" the FCC runs at roadsides periodically,
:+> but it seems as though many flaunt huge wattage anyway. What gives?

I'm not an Amp runner, by choice. The DOT decides what to consider
legal and illegal. The stupid moves are the ones that get caught.

As far as running wattage, there are a lot of little issues around
this...the basics of using one is not to intentionally disrupt
communications but to be heard. Some do it for competition, and
everyone involved knows what they're up against.

This is the grey area that I see as troublesome in
interpeting. Once again these IMO.

:+> 2. Since an amp may be easy to run, is it worthwhile? Should I get one
:+> and how strong?

Opinions vary, usually "strong" or strengths are measured in the
number of pills [RF power Transistors] that are used in any given amp.

The more pill pairs, [2,4,6 - 32 ... e&c] the "stronger" the amp is.

If you frequent this Newsgroup for a while, you can see that the above
is considered vague amongst the more serious into amping and volting
linears. But, the number of pills and the quality of the unit is what
you need to focus on in working with the basics.

Since signal strength, or dB-s, is only a relative indication - the
amount of power required to obtain a change of dB increase, depends a
lot on location, distance and terrain, let alone the station and the
antenna system support, this varies.

Other issues, like amperage capacity - supplying power to one of these
little black boxes is simple, but not easy to accomplish.

If you use one in a mobile, many vehicles can support a simple 2-pill, but larger pill counts get you into some very difficult problems in supplying the power necessary, and still provide a seat for the driver and maybe a passenger or two without having to think and perform some major and serious upgrades to the vehicles electrical system.

Although some of the solutions are....
... to say the least ...
... Unique! ... ;-)

For a lot of us, that aren't "dB'ers" - a 2-pill does more than enough.

:+> 3. What about power mics? Are they neccessary? Do they really make
:+> that big of a difference?

Opinions vary, but the majority use power mikes so they can improve the "loudness" of their radio - this doesn't always equate to better audio sound, only loudness.

Some people run power mikes to a point that makes you wonder about what you just tuned, or stepped, into.

Power mikes are nice, if you are a distance runner in a mobile. At least you can have your radio help you shout your lungs out as you travel.

I like to tinker, so my efforts are placed on setting up stock mikes to run like power mikes.

I'm considerate of others, so the subject of "power mikes", audible distortion, and intelligibilitiy are factors to me, I have neighbors.

:+> 4. What exactly do people mean when they refer to "DX." I see "DXing"
:+> and "DXer's" etc., but what are they talking about?

The wonderful world of 11-meters [CB band] is in the right portion of the Radio spectrum that allows for long distance communication possible - it's called skip.

http://www.iserv.net/~codyspc/skipis.htm - may help answer questions regarding how "DX" can work.

:+> 5. In the past, I had a radio tuned at a CB shop while I was traveling.
:+> The power was not increased, but it did perform better with less static
:+> etc.
:+> I now live in a small town with no CB shops. Are there any good places I
:+> can find on the Web to send in my units for servicing/tuning and so
:+> forth?

This NG is visited frequently by different CB shops offering sales and serivce. I suggest you stick around...

:+> 6. I have tracked down the significant source of noise in my vehicle to
:+> the fuel pump.
:+> Does anyone know of the best fix for a '93 Suzuki Sidekick, fuel

:+> injection? The local Chevy/Geo (Sidekick is a Geo Tracker) is clueless.
:+> Help. (BTW, both antenna and radio chassis are grounded. Through
:+> testing,
:+> I've ruled out plugs/wires/distributor. The noise comes on when the pump
:+> pressurizes, then stops, and returns when the engine is started.)

The best method is to relocate the antenna to the roof, if it's not
already there.

Bond, using a ground braid strap, muffler/tailpipe to frame
electrically to provide an RF ground for it.

Same can apply to the gas tank. My Tracker has a convenient open hole
on the gas tank, I use a bolt on the tank to a ground braid strap, and
then to the frame, to provide better shielding.

Rear tailgate can also use a strap on the hinge side to help reduce
RF. Bond tailgate, to vehicle main body.

Check http://www.iserv.net/~codyspc/engine1.htm to provide other clues
and cues to help you reduce noise.

:+> 7. Regarding modifications, I've been to several sites with such info.
:+> However, I'm still confused. First, I haven't been able to locate mods
:+> for
:+> my radio(s). Specifically, I have a Midland 77-115 and a realistic
:+> TRC-484
:+> (O.K., stop giggling everyone!) One site did list some numbers for these
:+> models, V7 or VR-5 or something like that, but made no mention of what these
:+> meant or what to do. Second, How much would mods cost? Would it be better
:+> to just buy a new radio? (My wife won't let me spend any more on toys.)

You radios came with an owners manual, and since you have the 77-115,
there are sites that offer these mods as you've noticed.

Since it's too long to go into here, just check out your Midland
Manual. Although I will admit that Midland has lessened the level of
comprehension these manuals offer, there is a section near the back of
the manual on the 77-115 particularly, that can help provide answers
to some of the different questions above.

In light of that, you mentioned cost, save your money. If you have to
send a radio in to be tuned, do it with someone you can trust. I'm
sure your E-mailbox will fill up soon enough with offers or replies.

I look at it this way, there are only so many ways to work on radios,
so there are "Techs" that can do what you ask, only you might not like
the results, or worse, actually enjoy the radio and keep your fingers
out of it.

The ultimate disasterous scenario, is winding up like me. Never
satisfied with other peoples work, and learn [by the hard way I will
add] how to do it myself.

:+> Thanks so much for your help. I hope to learn more and maybe catch some
:+> of you on the airwaves!
:+>
:+> New Guy

In simple terms, just stick around and read the posts. It' may be a
lot to wade thru at times, there are some tid-bits of valuable
information that can be gleaned from this whole mess...

Regards!
:+> Andy <+:

That isn't totally true.

It has been proven that you can put a graphic with a link in an email, and have it go to any url that you want.

At that point, you can load any HTML or DHTML and have it execute arbitrary code on the users machine.

Toll Free

> think it is cb radio) and could not care less.

that's the truth.
i still enjoy using my 706 [now a fresh new mk2g] to talk a couple
states away when i'm mobile. that's the most interesting part for me.
i do get tired of some of the local cb guys asking how much it cost.
where can they get one. does a power mic fit on it etc. and the
no radio guys asking me, 'do you think you have enough antennae on
that truck?' man if i could afford an outbacker, i cut the count
down alittle but now i have to stick with 4 tx and the factory rx
antenna.

on a note about cw, i think it's cool but i could never send any
if i had to use anything but the up/down buttons on the 706.
way too used to it by now.

as for low code/no code hams on hf, i've been making hf available
on my repeater for awhile now. always good operating procedures
and hasn't been a pain in the butt yet. hopefully now, they can
get their own rig and work hf when i'm not around to turn on the
remote base.

most of the higher classed hams in my area are stuck on 2m and
wouldn't know the difference if 20 new hams got on hf around
here.

You will probably need an RF sweep or tracking generator to properly align your typical scanner. This is not basic equipment that every CB jockey would have.

Mind you, if all of your bads are whipped, there may be a quick and easy fix.

Yes he should be able to if he is experienced in that field. At my shop I repair TV's ,VCR's, Microwaves, Scanners, CB's , Amp's (both CB and stereo) car and home Stereo's , CD players , Telephones as well as about any other electronic item that comes dragged in the door. If your tech is trained in general electronics than he should be able to figure out and trouble shoot just about any type of electronic circuit. He should be able to fix your scanner even if he cannot program it or operate it!

Seems there is more than just one loser in this newsgroup - And pretty
stupid ones too.

Check "Joe's" feedback on his auction web site. Two bad ones and one neutral
out of 8 deals that he did, that's a pretty lousy score. I would not deal
with people like that.
See: http://ratings.auctions.yahoo.com/show/rating?userID=K7JOE&

I'm doing you a favor trying to warn you for a guy that's auctioning an item
which doesn't resemble his own. If Uncle Joe were a real man, he would show
his customers a picture of his own stuff, even if it doesn't look as great.

Put those 5 brain cells that you have to work for a change, and THEN open
that big hole in your face that you call a mouth.

Pitiful.

I have cobra 148gtl st. There is a side band feature on the radio. I was into cb radios in late 70 early 80s and it has been a while. I am employed by a local trucking company. All the drivers use cb to chit chat and so forth. I have tried to use this side band feature with one or two others and had no success. There is a mirror mount four foot francis on my truck that is matched pretty well. Do I need a special antenna to operate on ssb.

Total waste if the original mic is a good one.

>
> 4. What exactly do people mean when they refer to "DX." I see "DXing" and
> "DXer's" etc., but what are they talking about?

on any other band this means talking to another country(long
distance).On the CB band it seems to mean any skywave contact,odd since
the CB band has the potential to reach from anywhere to anywhere with
legal setups.

howdy all, new to group(s) thought I'd ask some advice. I am looking for a set of 4 8950 tubes for an amplifier. Unit is a Palomar Skipper 300. Does anyone know what other tubes might work in their place and if mods are required to change over ? 8950's are getting hard to find. How About service manual or schematics for the skipper? any help appreciated. Jim

For Sale Uniden HR2600 allmode radio covers 24.5 to 29.0Mhz.10 watts AM,FM&CW and 25 watts SSB. I have changed the microprocessor with a chipswitch micro. which extend frequency range and adds more memory channel plus adds all the 40 channel CB band. For more info on the chipswitch micro checkout their web site at www.chipswitch.com. Comes complete with box,manual,chipswitch manual,mobil bracket,mic and power cable. Radio is mint never been mobil just like new 200.00 plus shipping

if you have any questions feel free to e-mail.

You should relax. I certainly haven't heard of you to begin with.
Secondly, I still have NEW (old stock) of HR-2510's. So what exactly
is -your- point here? Sounds as if you are meddling in someone else's
business..... "Mr. Cracker"? Haha... Yeah...

If you're talking about emergency communications (and I assume you are since you mentioned the Coast Guard), the ability to build a power supply is not a fundamental requirement. First of all, if we lose power, the power supply is useless (no power for the power supply).

However, nearly every single ham radio can be ran off 12 volts, Bill. Therefore, in an emergency, all the operator needs is a good car battery (and there are hundreds in my neighborhood).

Of course, in a real disaster, perhaps the ability to build a generator might be useful, but that has never been a requirement for ham radio. And where would you get the parts in that type of disaster?

And have you looked at the cost, Harris? To do what you are talking
about costs thousands of dollars for the computer, high speed modem,
access charges, and other items. A radio with this capability can be
had for considerable less.

The internet is not a direct threat to radio. Both CB and ham radio
are alive and kicking fifteen years after online services became popular.

What is a threat is the attitudes of the people. And, in my opinion,
the internet is the direct driving force behind the negative, smartass,
in-your-face, attitudes we see throughout our society today.

It is those attitudes that are driving people away from each other.
And that will happen on radio as these attitudes start to appear there
(it is already happening in many areas on the CB - younger kids with
these attitudes are driving away the older operators).

Okay, I'll accept that. That makes the story a little more
believeable. Now we just have to figure out the odds of a radio
microphone going out at the same time as the car breaks down.

> Hope it's not a little bit of that 'ham superiority' showing...

I was not trying to be mean-spirited here. I ended my message with a
smiley face to relay my humorous intent. I'm just getting a kick out of
all these stories with examples of how code has saved the day. Some of
them are a little hard to believe.

Well, Jay, I've been using a radio since the early seventies and I can only remember two occasions where a microphone broke. In both cases, the microphones were suspect to begin with (new, recently modified, etc.) and would not have been used in a situation where I needed reliable communications (and, in both cases, I had a spare immediately available). I use only the most reliable equipment in my vehicle, and repair anything that even appears to be developing a problem.

Now, I realise that is not typical for the average radio user, but even very few of those people would experience both the radio and the vehicle going down at the same time (unless they use junk equipment).

But certainly anyone with the knowledge to be associated with a CB shop, and send code with a broken microphone, should be using more reliable equipment.

> > You did sign your message with the words, "Hillbilly's CB Shop."

Now, Jay, can't you recognize a joke when you see one? I even added a "smiling wink" face to the end of the paragraph for the humor-impaired.

And, by the way, what has this discussion got to do with "attracting new people to amateur radio?" In case you're not aware of this, I'm allowed to post messages without my comments being judged by their ability to attract new people to amateur radio. It was a simple message, Jay, not an inditement of a particular radio service.

When did congress pass a law making "Slander" a criminal "jailable"
offense?? Last time I checked, Slander can be punished only in civil court
where the person doing the slandering is sued for damages by the person
being slander..

Please point me to the correct code section so that I may read up on this
new "jailable" federal offense..

Hey Dan, I'm selling my five-year-old Mazda 626 LX (dents, rust, and all) on Ebay. Can I use a picture of a brand new Mazda to show what it looks like? It is just a "representitive" picture of the car.

Look, I have nothing against Joe. But it is rather sleezy to show a picture with an item being sold when that picture does not show the actual item being offered. In the future, Joe might want to use a disclaimer in the text pointing out that the item in the picture is not the item being offered.

By the way, I don't have a Mazda for sale on Ebay (just traded it in on a truck). That story was just made up to illustrate my point.

Joe, the picture does not have to contain a copyright notice to be property. He owns the picture and you do not have a right to take, or use, something that he owns. That is the basic theory behind ownership rights and has been backed up in copyright case after copyright case.

oh so now , we cb types are supposed to pick up the slack now that the rules are being relaxed on the testing procedures for ham licensure. oh please , why suddenly are we being offered such wonderful inducements from those who a while ago and beyond wouldn't give any cb type the time of day. oh , so you think your marvelous uncle charley would actually take away your bandwidth if you aren't using it, so now we are supposed to all become hams. give me a break. i really don't understand this lack of understanding on the ham radio operator's part so i will try to spell it out for you . i operate illegally now. i have always operated illegally . that is the way things are done. i do not care what the fcc says. they are nothing to me but a minor irritant. now why do you think all of a sudden , that i should join your little organization , and become legal , just to save your little bandwidth from absorption. i will not and i am not. the only reason i would get a ham radio license and i say again the only reason, is to fend off the gendarmes, who you ham radio types are attempting to release on us per your little us pending legislation. i am going to be a ham so i can flash that stupid ticket at a stupid cop who pulls me over because i am bleeding on his stupid computer and that is the way i see it and i am not looking through rose colored glasses , do you think?, dan the ice cream man and i am back out.....

Several have already answered your question about the antenna. Lets look at your core problem of not being able to talk on SSB.

I'm willing to bet that your radio has been modified to "unlock" the clarifier - the clarifier changes the transmit frequency when you adjust the receive frequency. This is a common modification done by sleezy, often fake, repair technicians out to make a quick buck from unwise, at best, radio modifications.

This modification would make it darn near impossible for you to use SSB unless both radios were tuned to a high degree of accuracy (not possible with typical CB equipment due to frequency drift cause by the low-cost electronics).

If your radio has been modified this way, take it to a good repair technician to have the modification removed.

Has anyone had any experiences with Copper Electronics mail order, good or bad?
I'm installing a CB in my motorhome. It has a steel body frame, but is covered by fibreglass panels, sides and roof, with the only exposed metal being the windshield pillars. I would like to use a roof mount 3' Firestik, but I'm concerned about ground plane. Has anyone had any experience with the TriStar Base Mobile Ground Plane Kit?
Thanks,
Robert Hiebert,
Gibsons,BC Can

> exist in society, and existed long before the Internet became popular.

No, these attitudes did not start showing up on a widespread basis
until the mid-eighties - just about the time that online services became
popular. These attutides did not exist in public on a widespread basis
in the sixties, seventies, or early eighties. More importantly, many of
those people in the mid-eighties, with these attitudes, were heavy
online service users.

Now, perhaps you are right that these attitudes already existed in the
minds of the people before the popularity of online services. But
regardless of whether online services caused these attitudes, or online
services only made these attitudes seem more acceptable to display in
public, the end result is the same.

Buckaroo,

Spam on the Internet is usually referring to unsolicited junk email, usually trying to sell a product or "get rich quick scheme".

Typically many people get valid email addresses from these newsgroups, like you are participating in now. There are programs that will extract email addresses from the thousands and thousands of newsgroup posts for "spamming" purposes. By entering "nospam" into a reply address, it will fool some of the email address extraction programs.

Any user who wishes to email the original poster of a message typically must remove the "nospam" from the email address before it becomes a valid one. There are other ways to also discourage this, and the technique is usually described at the end of a posting.

Negative driver. If you can talk to another rig on AM you should both be able to talk a little further on SSB. You will have to use the fine-tune control to "lock" onto the other drivers voice. Of course, both radios will have to have to be SSB. Also, you'll both have to be switched to USB or LSB.

Why would today's prospective ham care? All he knows is that it's a shitty
connection. Like when you have a bad phone line. Or there's too much
&^$%&^$% static on the radio.

He doesn't know anything about propagation. MUF is an erotic term from
college. All he knows is that he's "getting bad reception."

The same antenna for AM will work for SSB, the antenna dosen't know or
care what mode you are operating. For you to communicate with another
station on SSB, the other station must also be on SSB.

I certainly agree that if a picture supplied is NOT of the actual unit
for sale, it SHOULD be CLEARLY identified as such. Surely the basic
REASON for a picture is to provide the buyer with a clue as to what he
might be ending up with - otherwise, what's the point of even
providing a picture?

Bzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzz..... wrong.

Firetalk is a FREE program that this can be done with, all you need is
a mic, a computer, a 56K modem. and your voice, another program is
hear me...

http://www.firetalk.com

http://www.hearme.com

both are great programs.

--> I think it merely reflects the negative, smartass attitudes that already
exist in society, and existed long before the Internet became popular.

--> Right, but he was pointing out that that's only true if you already have the computer. Let's run some numbers off the top of my head:

Computer (Used): Roughly $500, probably.
56K modem : $120
Mic : $5 for a cheapie
'Net access : $20/month, depending.

Used HF radio : $300 (if ya don't mind tube gear)
Coax, antenna : Probably under $100, if you "roll your own" wire antenna.

Now, as far as "bang for the buck" goes, it's still hard to beat my Drake TR-4, is what I gather from this back-of-the-envalope analysis. Of course, it all depends on what you want to do. If you want a reliable way to talk to a specific person in Australia, you're better off with the computer. If you want to chat with random, sometimes interesting people, and do something challenging in the process, well, the radio's going to suit you better.

Please allow me to clarify a few things Dan... The 'ham' world-body (all Countries) meets every ten years. At this meeting, input is given from ALL Countries as to the future of Amatuer Radio. The United States (FCC) is only ONE Country at the table. The general consences, was to go with only THREE license groups, and drop the code down to 5 wpm across the board. So.... "Uncle Charlie" was only ONE spoke in the wheel! I think it's safe to say that the majority ruled here. Oh ya, one other thing. 99 % of the 'hams' were AGAINST it.

Keep the clarifier locked so the transmit frequency dosen't change, then use the clarifier to clarify the received signal. The reason ham gear is "unlocked" so to speak, is because hams don't have channels, they can move to any frequency increment withing the band. Most ham transceivers have an RIT (receiver incremental tuning) control that lets you tune the other station in to your liking without moving your transmit frequency. This is so you can tune the other station in and he can use his RIT to tune you in and both station's transmit frequency stay the same, so you don't keep changing your transmit frequency and chasing each other all over the band.

Well said... I've got a buddy with an "Unlocked Clarifier"... having that
mod removed from his radio made SSB easy to use... for both of us. The real
joke is when 3 or more SSB CB's with the "unlock mod" done try to get
together for a conversation on one frequency... nigh unto impossible.

Is it just me, or are these the worst receiving radios on the market today? The Co. I drive for just got 18 new tractors, all with the new 29's. Just about every one of these radios receives the same way,--- terrible. You either have to listen to all of the noise, squelch back, and gain up, or if you try to squelch and gain the noise level out, the sig.s, unless they are powerful or just close, come in all choppy. Everything else with the installations is good, double mount ant.s, on the mirrors, good grounds, the swr,s all under 2, so what gives with these P.O.S. radios? Does anyone out there know what I mean? And as far as the Soundtraker gimmik, sounds like a bad digital cell phone call to me. I know I could put my own radio in, but it's a Co. truck, and I figure, let them spend the money, besides, the last trucks we had, had little Uniden 66's peaked and clipped. Say what you will about the Unidens, but those radios kicked butt, no complaints, not compared to these Cobra's. Thanks for any advice on this annoying Cobra radio.
.....DT.

Wrong. For the most trouble free operation the Rx/Tx frequency should
be tied together and movable. Without this setup being the primary
goal, you are asking for trouble.

You missed the point. I wasn't talking about emergency disaster communication, I was talking about the technical know how to design, and build something as simple as a 12 volt, 20 amp power supply so you could use a mobil transceiver from your den or work shop in your home or office.

Yes most hams should be able to run their equipment of their car batteries as most of the new equipment comes with the cabling and instructions on how to do that. But could they build a voltage regulator circuit to run off the cars ignitions system to supply say 6 volts dc? or something other than 13.8? That's my point. Although its been a while since I actively looked at some of the electronic magazines, and ham magazines I haven't seen much of those circuits that I thought I could build. I know my way around a soldering iron, and can read a schematic. But don't ask me to mess wish some digital stuff it just wont get done.

Sadly today most hams are appliance operators. This had been going on for years! not since the no code went in to effect. I have a couple of friends who are techs before the code came in and they had problems soldering a simple pl connector.

Once again it's not the code that's the problem though it can be tough, it's the theory that you need to know to build and understand your equipment that should be stressed.
regards
Bill Carty

Just curious who all out there has an eight pill? Just thought I would get some CB conversation going here.... no offense to the HAM's... but I am beginning to think I am in the wrong newsgroup... <g>

Anyone have pics of any of their linears, post em... Next week I should have my little dandy Mavica piece of crap (not really, but hey it saves RIGHT TO DISK).... I'll take the photo then.... Just curious I guess to see who is all talk.... Lata...

Hank, Jeff, Charles, does it matter?

Yup. You'll need a service manual to figure it out but it's pretty easy. Just look at the signal diodes associated with the band switch 10 meter position. figure out the least significant three bits in their proper order. Then figure out the binary number and subtract 1 for the freeband 27.5-28. or 2 for the regular band 27.0-27.5. You'll need to do the same scaling on the display matrix as well if you want it to read out correctly. (otherwise it will display 28)

good luck.

p.s.
If you don't know what i'm talking about ya might consider just getting an ham radio license. It might a lot easier for ya.

(not slamming the FB'ers here. hell, i use my 530 on 27.5xx+ all the time! Just trying to keep the riffraff on the ham bands where it belongs.)

500. Re: why should we.....

It seems to me that 99% figure may be off just a tad. I've watched this CW debate on other NGs and it appears to be a major issue. Anyway, the differences between the two types of operators appears to be on opposite sides with the love of radio being in the middle. A week ago I was put down because of the type of radio (band) I use. Now, the messages in my mail box are "come on in the waters great!" The three of you that are emailing me with this "flip-flop" stuff really should stop. I won't post your names so I don't expect a bunch of silliness like the last poster. So far I've been able to enjoy life without the need for clubs, frats or organizations. Maybe icm is right, is it a use it or lose it situation? How did your ranks get to the point that it is today? It was not just the smoke signals, err, morse code was it?

GFD. CW is a complicated solution for a single point failure. Hardly worth the effort. Totally impractical. Of course, that it part of what ham radio is all about. The pursuit of impractical solutions just for the sake of saying ya did it.

Thankfully CW is ALmost a dead issue in relation to a licensing.

You'r numbers aren't even close.

I bought a 300Mhz system 4 months ago that included:

56K modem, soundcard, cdrom, speakers, microphone, NO monitor

For $300. I had a monitor, but you can buy a decent one for $200 (even less).

My net access is only $7.95/month unlimited. The "average" in my area is
about $13/month.

>Used HF radio : $300 (if ya don't mind tube gear)

You don't have to worry about signal strenght with the computer either. No fading signals with atmospheric changes, etc. It's clear all the time.

The randomness is just as easy with the computer. The software used connects you to countless "chat rooms" that you can select by topic. In any given room, there will be a minimum of 50 people. All will have their location listed (assuming they are honest). You can pick and choose from there.

I am just curious and don't want to ruffle feathers... But
there seems to be an underlying race on to become a 50
megawatt radio station just for CB, Have you ever driven
near a 50 or 100 megawatt AN radio station... you can not
hear anything on the CB and the car radio dies out. Now the
is from a clean station. Aren't you going to roast your
selves from RF radiation? LOL
You are gong to draw enought power to dim your whole town
<g>

Cheers,
John

Well, like I said in another post, the belief is questionable,
but the story would work.

The only way I would see it as 'believable' instead of 'practical'
would be if he and his wife (they know CW, so maybe this is
possible) had been jacking around doing this already, so it
was not 'something new' to them.

Even still, I'd wonder why SHE transmitted CW back to him,
unless like I said, they were already jacking around with CW
in this manner.

And yes, the stories.... It's like the stories in Penthouse. You
KNOW they aren't true, but there is the possibilty that the
'pieces' of the stories may have actually happened, over a
period of years, to multiple people. Just someone puts them
together to 'tell a story' kind of thing.

Is it better to have a whole load of batteries if, you do not have the alternator power. For example, 16 pill with a 200 amp alternator is not enough because you will need a 4 pill driver as well. If you were running a 16 volt system, with 8 volt batteries. How much would it help your system if, you had a total of (8) eight volt batteries together instead of let's say (4) eight volt batteries???
would it make alot of difference since we already know that we don't have enough alternator power.
Thanks for all replies in advance.

In terms of practicality, and from a time invested standpoint, it would be much cheaper and less time consuming to just pack a spare mike (or 2) in the event that your primary mike fails, rather then learning to send (and hoping others can receive) CW, so that if your mike should fail at precisely the same moment that you have an "incident", you can simply change mikes, rather than having to rely on CW proficiency.

Nonsense, if the rec and transmit freq are tied together, then when you retune a station to make him sound like you like you then shift your transmit freq, then he has to retune you to make you sound like he likes and that shifts his transmit freq, then you have to retune, then he has to retune, ect., ect., ect. You wind up chasing each other. The best is to leave the transmit frequency on one spot and then all stations clarify by adjusting the receive frequency.

Yeah, I've checked and it appears quite normal, around 3.5 watts, so no
there's no extra strain on the power supply. Thanks for the suggestion,
though.

Hello RacerX: Thanks for the flowers.

Don't worry about the other two Penetrator 500 antenna configurations.
You have a modern one that is rebuild-able, and you have all the
assembly data to make it work.

If you need new parts I have them. Please let me know you make out
there.

Hi John,
Just a little "codeless tech" bashing as flame bait. As long as we're
at it, I figured this thing is bound to spin to code/no code, new
license
restructuring, CB versus Ham, Fractenna, and other
great urban myths that we can spend all day arguing about.
In other words, it was a JOKE.

Yep, I know what you mean... I have a Cobra 148 GTL ST and as far as
I am concerned it is a piece of shit.. Likewise, I thought it was my
radio, but it seems it is most of the Soundtracker radios... I will
not buy another Soundtracker or even a Cobra for that matter.... I
shouldn't have steered away from Uniden...

I don't think this is a detriment. I'd rather have a bunch of
appliance operators, with radio appliances around in an emergency then
a bunch of old parts sitting around and trying to build a CW
transmitter to hopefully get some emergency communications going.
What I'm saying is that it would be nice if ham radio could become
more popular to a broader range of people, rather than to just a few
technically adept individuals.

Of course I have that right. I'm not held in bondage to political
correctness. You just did the same above by calling anyone who doesn't
share your view as an "old fart", did you not?

> There's a difference between "liking" someone, and tolerating someone.
> No one is suggesting that you give new a 5 WPM extra a big Barney hug,

There is certainly a difference. I am required to like nor tolerate no
one. No one is "entitled" to my respect. Your "hazing ritual" line is
another which I find offensive. I've decided to neither like you nor
tolerate you.

> anyone, based simply on their perceived "worthiness" (in your > opinion).

I've not decided to refuse "good will" to newcomers. I've decided not
your decree of who should sell equipment and throw in the towel. While
prejudice can be a bad thing, you weren't appointed arbiter of who is or
isn't prejudiced or of who should stay and who should leave amateur
radio (leaving more room for the "rest of us").

> If they pass the required FCC tests, they are entitled to the privileges
> as hams, as set forth by the FCC.

Agreed but I don't need to throw in a towel, sell my gear or to like any
one of them.

> Bottom line: your opinion is irrelevant. The law is the law.

Oops. You don't get to decide what is irrelevant and, in this case, the
regs are the regs.

Robert,

We have sold hundreds of the Tri-Star radials.(see mobile antenna parts
& mounts on our webb-site) However I really do not believe this item
will really do you any good. My opinion is that it is more of a novelty
than anything else.

Check out 'CB Mobile Antennas' on our webb-site for no ground Wilson and
Solarcon antennas. This is the way to go for the described
condition/situation as per your post.

I'm tired of explaining this. If you spent any time at all talking on
SSB, especially to multiple parties, then you would know that there
is only one "best solution" for getting all the parties involved on
the same frequency. And that is what i have already explained.

549. antenna advice

Need some antenna advice... Recently bought a Pontiac Silhouette van from a relative. (I should say stole the van... 1990 with every factory option, full leather and power, > 23,000 miles, always garaged, no bad weather driving, little old lady owned, as new, $2500) I would never have chosen this as a new purchase, but to good to pass on.
Any way, the body on this thing is all plastic or fiberglass.
I will be putting a small cb - Uniden Pro 520 xl - I have a couple of these laying around- with no mods or linear. I have no need to talk to the shrimp boats down in the gulf or either coast, just the traffic around me.
What would be a good antenna for this vehicle? I don't really want to drill holes in the body, and my work on inventing a plastic magnet has stalled since I quit drinking.
On my pickup and Cherokee I use Wilson mag mounts, and have been very satisfied with them.
Your advice is appreciated.
Thanks,
Joe

And the reason why you don't have any of those problems, (chasing,
multiple adjusting), is because the clarifiers are open.

Always a seminary student who ends up making himself look like he's judging people (by being no different than who he replied to, really) and turning everyone off to Christianity which defeats his purpose in the first place - to turn people toward Christ, not push them away. You need to use that brain that God gave you a little more and THINK before you speak. God didn't put you here to correct people's wrongs. He already did that. Learn where your proper place is. Even Jesus "put down" the Pharasies. Read a little more, talk a little less. No offense.

No, of course that isn't legal. You would stand a better chance of staying out of trouble if you used GMRS UHF equipment. This could be obtained for about the same price.

There has been a code exemption for physicaly handicapped people whos
disability kept them from doing medium speed code,look wow that was
abused.
There wasn't a mental disability waiver because no one is that
disabled.(you could be the exeption).

noise cancelling mics are a crock! (although they will sound great if matched correctly with radio)

go with a 575m6 or d104,if you need or want power,otherwise if your radio is somewhat middle-upper class, the stock mic should be good to get the job done.

you are correct in saying batteries are not a substitute for alternators
because a battery stores a charge and a alternator provides one,but what do
batteries provide dc current and what does the alternator supply dc current
which one you get it from makes no differance.

If this discussion is any indication, it's ALREADY impossible to find
meaningful, intelligent and mature people to communicate with on the
internet.

Well! I'll have you know that I was being negative, smartass, and
in-your-face on the Plato network twenty-four years ago. I didn't need the
internet for that and neither should anyone else!
(ATTENTION: Although it is not fictional, this HAS been a joke :-)

Please tell us where you went to medical school. My friend, who
is an RF design engineer, my antenna Elmer, and was, for many
years, the chief engineer for an AM broadcast station, tried
for hundreds (maybe thousands) of hours to get to 13wpm. His
most sacred goal in life was to be a general class amateur.
He never made it to 10wpm. Walk a mile in his shoes before
showing off your gross ignorance.

The overwhelming majority of the time these radios are operated
"unlocked'. If not then you have a radio problem or operational
problem.

>I have
>had a 148 and 2950 that were unlocked but I fixed them.What is the
>point?

You fixed them? By making the tx/rx untie able and/or unmovable? If so
then how do you use these radios? As a doorstop?

There was a time, not long ago, wherein the FCC was made aware
of persons using the Marine Band for other than shipboard
communications. The persons were using these for about the same
reasons you have mentioned.
The FCC's unofficial reply went something like: It's not a bad
idea as it reusues frequencies in an non-interfering manner. I
presumed this to mean, If your not bothering actual ship to shore or
ship to ship communications we'll turn a deaf ear.
I don't know how they feel about it now but it seems to me a
good idea to reuse those frequencies inland. I believe the other
persons I spoke of were farmers in the mid west.
Good luck.

586. radio w/ linear amp vs. radio w/o linear amp

Newsgroup: rec.radio.cb
Date: 2000-01-05 00:00:00 UTC
From: James Dillon <jdillon@mjpmedical.com>
Message-ID: <8510qppcq1@schenectady.netmonger.net>
Source record: 18435

hi gang:

I have just gotten a new Uniden Grant XL. I have a '99 Ford Econoline V6 Conversion Van. And, I have a relatively old Texas Star 100 Linear amp I got used last year. I have the amp powered directly to the battery and the radio I have powered from the utility power plug in the dashboard,(I use this radio in another 4x4 w/o amp). My antenna is a Wilson tunable 4' 5/8 wave mounted to my driver side mirror.
The problem is this:

When I am using the radio with the amp on, I hear great but,
I am not putting out any strong signal if any at all. Conversely, when I am not using the amp, I am told that I am sounding great within 5 mile radius. I have gounded the antenna to the chassis by the steering column. (that lead is no more than 18"). The best SWR reading I have managed without the amp on is a 2.1. The amp is grounded to the chassis also. When I am heard with the amp on I am told that the signal sounds very metalic or that I am on the SSB and not on the channel.

Could anyone help me with this situation?

Many thanks....Jim from Long Island

It's funny how the old school has that certain blindness when the new class walks in. I'm certainly not one of the young ones but I've watched the new class build all types of electronics that the old class couldn't even imagine. I've seen young hams buil miniature control circuits and repair these tiny handy talkies with surgeon's glasses on. I don't understand it all but they do. Is amateur radio worse now?

I think not. I have two radios on my desk that, combined, cover 100 Khz to 3 Ghz. I can transmit on all the bands I am licensed for. Best of all they are scanners too! Wow! They've got my attention! Thanks a bunch to the new class. I'm GLAD that they are not still tinkering with CW keyers, tubes and 20 pound one-band radios. As I watch them I learn. But you can't learn with your mouth open.

Robert a no groundplane antennae is a good choice but if you want a ground plane, you need to place a metal platelet on the roof of the motor home.

Sinse there are no other flat areas on a motor home, the earlier suggestion is the way to go. Wilson makes some of these antennae's and can be contacted at the manufacturer. They are very polite and positive about their antennae's and will sent you a replacement if you get the wrong one.

Try a Wilson 1000 or 2000 they work great
cost about $80.00

If you are not sure what you want Radio Shack makes a decent unit for about $30.00

A K 40 is another great unit for the radio matchup. Again $80.00

Your radio output is only as good an the antennae you use with it.
Go for the Wilson or K 40, you will not have any problem. If you cannot install it, have the dealer do it for you at a nominal charge.
Do it right the first time and avoid headaches and heartaches later especially in your wallet.

Hmmm, I've probably seen a hundred sliders modified by sleezy techs and I can't remember ever seeing one that wouldn't tune to another radio because of the inaccurate, low tech electronics. I guess all them CBs better go in the trash. Hey everyone, you better get a high tech ham radio and modify it for CB or else you may not get accross the street with it!

Guys, get a life, it happened, you won't change it here. I
know and use code often (as a LOWLY tech+ until the change).
Haven't been able to get to a testing session to upgrade
(they have this tendency to have them on Friday nights at
7:00pm, I get off work at 3:30 and live 100 miles away).
Instead of bitching and moaning why don't you all try to
help someone new learn something instead of being self
centered about MY bands.
Mark
ps: now I know why I like eme, thet don't care about what
class of license you have, if you can put it on the air you
must know what you're doing!

Hi,
Use 6KD6 instead, it is almost same except for the heater voltage, If you use 2 or 4 of them, you can make series and parallel connection to make it work at 12V. The pin out is almost same, just need to make one terminal change. You can get 6KD6 for less than $30 each.
Good luck.

snip
>IF everyone simply leaves the transmit frequency alone, then everyone can
>use the clarifier to tune the receive to their liking.

To one radio only !!!!!!!!!!! What happens with two radios?

****

Since when is a CB radio stable frequency wise?

Since when is your frequency standard aligned with every other
persons frequency standard?

Since when are CB radios not used in mobiles where the temperature
dictates what frequency you are on?

****

All that being said, it is a fact that you will NEVER get multiple
SSB CB transmitters to be on frequency with each other. If this
misalignment is the norm, which it is, then how would you align
your receiver to two different transmitters on two different
frequencies? How would you align your receiver to six different
transmitters on six different frequencies? The answer is it is
impossible when the operators transmitters ares fixed, and very
impractical (stupid) with movable transmitters that are not tied to
their receiver.

There is only one practical way to get multiple SSB parties on the
same frequency. Every radio must have tx and rx tied together and
movable. There is no other way.

There is do's and don'ts when adding batteries, if you have enough alternator the less batteries is usually better, if you dont have enough alternator than you can add more batteries, but the more batteries you add the more current draw is wasted on trying to charge batteries that are being pulled down, point is, if you add a bunch of batteries to a small alternator, than you are just going to pull down closer to battery volts. remember if you are charging a couple of volts above the battery voltage, then your alternator will still see the current draw, no matter how many batteries you have.

Yes, new callsigns should be restructured too. They should look like the
old CB callsigns of the early 1970's. This will work out OK because the
restructured hams won't be much smarter than your typical CBer anyway.

To add to this... if the AARL wouldn't be so hung up on its self, maybe they could of fended off some of this by supporting more channels for the cb's. If the freq coverage for cb went from 26.500 to 27.500, this would be more than enough for us who us cb and don't care to get a ham ticket and be in some club we don't want to be in. Instead, they fight to keep us in the 40 channels but they are always looking for more. When was the last time we had channels added. Way to many years ago. So now allot of us freeband and enjoy it. The FCC can get rid of the code but I still won't get a ham ticket. I'll stay were I am at with my ft-840 and free band. I hope the FCC takes away some of those freqs from the ham areas. Maybe the AARL will wake up and fight for everyone and not just the ham guys. Might just bring some customers there way.
my 2 cents.....
Randy

Everyone tunes ssb so the audio sounds best to them, which means if you shift your receive frequency so the signal sounds better to you and you also shift your transmit frequency, then when you transmit the other station will retune you and the you retune him and so on and so on. It isn't hard to understand that you will be constantly retuning. IF everyone simply leaves the transmit frequency alone, then everyone can use the clarifier to tune the receive to their liking.

How heavy of wire are you going to use? May have the solution that will work.

*them and realized that the 'majority' wanted to dumb down ham radio.
*
*
*
*D
****

If you took time to read the original docket you may have read the section where they sought comment on how many license classes should there be. The FCC even last August was leaning the the possibility that three classes of license was a possibility. There is no blame on anyone. This i ssomething that was bouond to happen. No matter how unpopular it may be it was going to happen. At this point you have only two options, accept it and keep operation or reject it and let your license expire.

*>
*> *
*> *
*> *NEWINGTON, CT, Dec 30, 1999--Amateur Radio will get a new look in the new
*> *millennium. The FCC today issued its long-awaited Report and Order in the
*> *1998 Biennial Regulatory Review of Part 97--more commonly known as
*> *"license restructuring." The bottom line is that starting April 15, 2000,
*> *there will be three license classes--Technician, General, and Amateur
*> *Extra--and a single Morse code requirement--5 WPM.
*> *
*> *"We believe that an individual's ability to demonstrate increased Morse
*> *code proficiency is not necessarily indicative of that individual's
*> *ability to contribute to the advancement of the radio art," the FCC said.
*> *
*> *Besides drastically streamlining the Amateur Radio licensing process, the
*> *FCC said its actions would "eliminate unnecessary requirements that may
*> *discourage or limit individuals from becoming trained operators,
*> *technicians, and electronic experts."
*> *
*> *Although no new Novice and Advanced licenses will be issued after the
*> *effective date of the Report and Order, the FCC does not plan to
*> *automatically upgrade any existing license privileges. The
*> *ARRL had proposed a one-time across-the-board upgrading of current Novice
*> *and Tech Plus licensees to General class, but the FCC declined to adopt
*> *the idea. This means that current licensees will retain their current
*> *operating privileges, including access to various modes and subbands, and
*> *will be able to renew their licenses indefinitely.
*> *
*> *Starting April 15, 2000, individuals who qualified for the Technician
*> *class license prior to March 21, 1987, will be able to upgrade to General
*> *class by providing documentary proof to a Volunteer Examiner Coordinator,
*> *paying an application fee, and completing FCC Form 605.
*> *
*> *The FCC's decision not to automatically upgrade Novice and Tech Plus
*> *licensees means the current Novice/Tech Plus HF subbands will remain and
*> *not be "refarmed" to higher class licensees as the ARRL had proposed. The
*> *FCC said it did not refarm these subbands because there was "no consensus"
*> *within the amateur community as to what to do with them.
*> *

*> *As it had proposed earlier, the FCC decided to lump Technician and Tech
*> *Plus licensees into a single licensee database, all designated as
*> *"Technician" licensees. Those who can document having passed the 5 WPM
*> *Morse code examination will continue to have the current Tech Plus HF
*> *privileges. "If documentation is needed to verify whether a licensee has
*> *passed a telegraphy examination, we may request the documentation from
*> *that licensee or the VECs," the FCC said.
*> *
*> *In addition to reducing the number of license classes from six to three
*> *and eliminating the 20 and 13 WPM code tests, the FCC also will reduce the
*> *number of written examination elements from five to three, authorize
*> *Advanced Class hams to prepare and administer General class examinations,
*> *and eliminate Radio Amateur Civil Emergency Service (RACES) station
*> *licenses. RACES will remain, however. "After review of the record, we
*> *conclude that we should eliminate RACES station licenses because RACES
*> *station licenses are unnecessary for amateur stations and amateur service
*> *licenses to provide emergency communications," the FCC said.
*> *
*> *Under the new licensing scheme, there will be four examination elements.
*> *Element 1 will be the 5 WPM Morse code exam. Element 2 will be a 35-
*> *question written test to obtain a Technician license; Element 3 will be a
*> *35-question written test to obtain a General license, and Element 4 will
*> *be a 50-question written test for the Amateur Extra license. The FCC has
*> *left it in the hands of the National Conference of VECs Question Pool
*> *Committee to determine the specific mix and makeup of written examination
*> *questions. Current Amateur Radio study materials remain valid at least
*> *until the new rules become effective in April.
*> *
*> *The FCC's new licensing plan means someone will be able to become a ham by
*> *passing a single 35-question written examination. The plan also simplifies
*> *and shortens the upgrade path from the ground floor through Amateur Extra-
*> *-especially since amateurs will only have to pass one Morse code test.
*> *
*> *Elimination of the 13 and 20 WPM Morse requirements also means an end to
*> *physician certification waivers for applicants claiming an inability to
*> *pass the Morse code examination due to physical handicap.
*> *
*> *The effective date provides a window of upgrade opportunity for current
*> *Advanced licensees. Between now and April 15, current Advanced holders may
*> *take the existing Element 4B, a 40-question test, giving them credit for
*> *having passed the current Extra written examination. Likewise, holders of
*> *a Certificate of Successful Completion of Examination (CSCE) for Elements
*> *3B or 4B dated on or after April 17, 1999, will be able to qualify for
*> *General or Amateur Extra respectively when the new rules go into effect on
*> *April 15, 2000.
*> *
*> *The FCC disagreed with the League's suggestion that it undertake a
*> *restructuring of operating privileges along with licensing restructuring.
*> *"We believe that in light of ongoing discussions concerning implementation
*> *of new and more modern communications technologies within the amateur

*> *service community, we should accord the amateur service community an
*> *opportunity to complete such discussions and possibly reach a consensus
*> *regarding implementation of new technologies before we undertake a
*> *comprehensive restructuring of the amateur service operating privileges
*> *and frequencies," the FCC said in its Report and Order.
*> *
*> *In its amendments to Part 97, the FCC's Report and Order refers to a "Club
*> *Station Call Sign Administrator," something that does not exist under the
*> *current rules and which was not explained in the R&O itself. An FCC
*> *spokesperson said the Commission plans to issue a Public Notice soon to
*> *explain the program and to solicit qualified entities to serve as call
*> *sign administrators for club station applications.

And you will not have everybody on the same frequency because as soon as
one retunes to clarify the received signal he has just also moved his
transmit frequencey.

Do not waste your money on their Chinese tubes, regardless of whether or not they claim to be matched. Look for some of the oldies but goodies. Two of those with the right transformer will do more power with better longevity than three of the Chinese tubes on the same transformer. If your going to do it, do it right the first time. The extra cost now will pay for itself later. Sean

I know I know. Sorry. It just makes me mad to see "Christians" going around nit picking on people. I think that if I didn't already believe in God, and it was up to that man/woman to be a spokesperson for God to me, I would've walked away. I know that person has a right to free speech, but when you become a "Christian" you shouldn't want to go around condemning people. I mean, if God doesn't condemn us ("...God sent NOT His son to condemn the world..."), then why should we? Real Christians have a responsibily to be accountable to each other and correct each other ONLY in love. This person, first of all, had no guarantee whether the other guy was a "Christian" or not. In other words - why hold someone to a "Christian" standard if they don't even believe in Christianity? Secondly, even if the guy was a "Christian" - it just didn't seem like love based advice. You have to draw the lines somewhere don't you? I could care less if that guy "cusses like a sailor". So what?! I'm sure Jesus hung out with "cussers" and loved them anyway - not "rebuke" them. And I said "no offense" because I meant it. I'm almost afraid to tell anyone I'm a "Christian" nowadays because of the immediate stereotype of "CONDEMNING JUDGE" that usually follows. I wasn't trying to condemn. I was trying to give a little advice. But I guess maybe it came out wrong. Like said - I'm sorry. Point taken.

I'd like to thank you guys for confirming what i have been trying to tell this group for the last several years. DON'T WASTE YOUR MONEY ON COBRA CB PRODUCTS. I do have to admit that their power inverters are probably the best on the market though.

Uniden is typically the way to go for greatest reliability / bang for the buck in the standard 40 channel market. Uniden's ASC circuit is NOTHING like the Soundtracker. It is an automatic squelch control and "gates" up and down by itself. When this feature is activated, it disables the manual adjustment of the squelch. With the noise level the way that it is lately, it may not be able to automatically adjust high enough to cover up the noise. It can be quite useful when running at night or during quieter days though.

Uniden's weather radios (which are also much better designs than the Cobra's) also come with the lighted trim rings around the knobs. Visibility at night is greatly improved. Their method of doing this is far more reliable than the way that Cobra is doing theirs.

Keep in mind that these are strictly my opinions and observations. How much value you place on them is up to you. Sean

These were made in Cali by the same guy that makes the current "blue face" amps. Was a good amp for what it was. Good luck finding some stud mount 455's. Might be better off with 454 A's and doing some retuning, depending on price of parts and labor though. Sean
>

I sincerely doubt that the PLL is going out of it. Chances are that you have a bad solder joint and the radio is intermittent in performance. This is quite common in these radios while popping PLL's is not. Having the radio mounted by the chassis bracket can really aggravate this problem. The chassis twists from bumps in the road and causes the board to flex, making and breaking connections at random. Might be good for two days or two weeks, just depends.

Then again, someone temporarily "fixing" your problem and charging you for a new PLL each time can be a good profit maker for a crook of a cb tech. Be careful..... Sean

Keep the carrier level down to a reasonable level. About 125 - 150 watts of carrier coming out of the amp will give you plenty of distance with punchy audio. Going up on the carrier may look better on your Bird, but will begin to compromise audio quality and volume. Sean

Tnom is right. The problem is that most IDIOTS that install sliders do not correctly align the radio. Even though the radios' rx and tx are now locked together, they never compensated for the offsets involved. This means that they both slide at the same rate, but are still on different frequencies. IF, and this is a big IF, they did the clarifier mod and re-aligned the radio correctly, a slider is a beneficial thing and the only way to have group participation ssb based rag-chews. Unfortunately, most aren't done correctly and people run into problems like JJ has experienced. You can thank all of these "tune up manuals" and "do it yourself radio mods" for this. They left out half the directions and forgot to mention that you need accurate test equipment to do the job right. Sean

To one radio only !!!!!!!!!!! What happens with two radios?

****

Since when is a CB radio stable frequency wise?

Since when is your frequency standard aligned with every other persons frequency standard?

Since when are CB radios not used in mobiles where the temperature dictates what frequency you are on?

****

All that being said, it is a fact that you will NEVER get multiple SSB CB transmitters to be on frequency with each other. If this misalignment is the norm, which it is, then how would you align your receiver to two different transmitters on two different frequencies? How would you align your receiver to six different transmitters on six different frequencies? The answer is it is impossible when the operators transmitters ares fixed, and very impractical (stupid) with movable transmitters that are not tied to their receiver.

There is only one practical way to get multiple SSB parties on the same frequency. Every radio must have tx and rx tied together and movable. There is no other way.

Not exactly....(and not smoking the funny grass:) You wanna talk DX,....
what YOU REALLY need is a radio with a VFO (NOT a channel selector) where
you can move "between" channels. If you already have one of these 10m/11m
rigs, then you know that having the RIT/Clarifier "unlocked" will move your
Xmit off the frequency you just tuned to.... forcing the other fella to do
the same as he chases your signal yet further up the band.

Ok I've got one for everyone. I'm looking for an AM/SSB radio. It must be smaller than 2.25x7xd. D can be pretty much anything. Something in this size is almost definately going to be a "new" style, but just to clarify I prefer no chrome. Also if the radio is a 10 meter all the better because I'll be doing the testing thing real soon, unless I can hold off until the new restrucuring takes effect. I was looking at the Eagle Sidewinder (I can get one for cheap if the guy still has it). Is this a good choice? What else is there? More power, more channels, more features whatever just find me a radio. Cost doesn't mean anything if it's quality equipment. No junk. Thanks in advance.

Ever try to use a computer while driving a vehicle? I use a handheld
radio in my truck, on a boat with my Coast Guard Auxiliary activities,
and when walking around the mall. The internet is simply not as
flexible as that radio (and neither is a cellular phone).

And then there is the art of radio communications. The internet
cannot offer anything like the challenge that comes from making a
distant contact with a station that you set up with your own hands.
There is nothing sweeter than that point when you know everything in
your set up is perfect, and you just know you can make that dx contact easily.

Richard, the proper way to use a radio (CB or Ham) on SSB is to adjust the receive without adjusting the transmit frequency once it is set. On a ham radio, the device to do this with is called the RIT control. And it works very similar to the clarifier on a CB.

With a ham radio, the process works something like this. Two stations agree on a frequency (there are no channels on the ham bands). Both stations tune their radios to that frequency. Both stations then use their RIT control to fine tune the receive to hear the other station properly.

The process is similar on the CB band. Except, replace the word "frequency" with the word "channel," and replace the "RIT" with "clarifier."

In fact, that is the proper process for SSB radio operation on every radio service that I'm aware of (military, marine, etc.). With this in mind, it is therefore rather crazy to modify a CB radio so that it will not operate this way anymore.

Leave the clarifier alone if you want to ever use the radio on SSB. And, if the radio has already been modified, get the modification removed by a proper technician.

A CB radio is not stable enough to do this.

You haven't been operating for long then. The overwhelming majority of
the time these radios are operated "unlocked' or with the tx/rx tied
and movable. If not then you have a radio problem or operational
problem.

> Leave the clarifier alone if you want to ever use the radio on SSB.
>And, if the radio has already been modified, get the modification

Leave the clarifier alone if you want to use the radio as a doorstop.

Okay, I'll try to explain this step-by-step. You and a friend want to talk on sideband, and both radios have been modified so that the transmit frequency changes with the receive. You both turn your radios to the desired channel.

1. He adjusts his radio so that he can hear you clearly while you talk.

2. He then talks while you adjust your radio to hear him clearly.

3. Since your transmit frequency changed when you adjusted your radio, he has to now adjust his radio again to hear you clearly.

4. And, since his transmit frequency changed when he adjusted his radio, you now have to adjust your radio again so that you can hear him clearly again.

5. And. since your transmit frequency changed when you adjusted your radio, he....

This process can go on forever. And, if either of the radios is greatly out of tune (typical), the process can be even worse.

With the clarifier set like if came from the factory (unmodified), the process is simple - each turns to the desired channel, each uses the clarifier to adjust his receiver to the other, and the conversation begins.

Other than an initial chase, when multilple radios have unlocked
clarifiers there would never, within reason, be a need to move again.

If you have ever gotten into a conversation with multiple (more than
one) non unlocked radios then you would know that in the real world
your method is impossible with a fixed transmit.

This topic keeps coming up from time to time. It is obvious, once you
spend some time talking with multiple parties on SSB that a fixed TX
makes your radio almost useless. The best solution is the mod that
was developed to eliminate this problem. It's to bad that some can't
visualize the flaw with a fixed transmit radio or the flaw without
the ability to tie rx to tx.

MultipleMultipleMultipleMultipleMultipleMultiple
MultipleMultiple MultipleMultipleMultipleMultiple

How can this many radios, represented by the word multiple,get
on the same frequency when their transmitters are locked?

> may not get accross the street with it!

Mike, I did not say that. I said that it was impossible to tune a typical CB radio to a high degree of accuracy due to frequency drift cause by the low-cost electronics. I did not say that the radio was not usuable due to the low-cost electronics (or due to frequency drift).

CB radios are designed to work in situations where not all radios present are tuned to a high level of accuracy. However, a problem occurs when the radio is modified to work differently than it was designed (a modified clarifier). The radio is simply not designed to be accurate enough to work properly with this modification.

The same problem presents itself when the operator attempts to communicate with another radio that has never been tuned properly.

The solution, Mike, is to simply use the radio exactly like it was designed by the manufacturer. After all, I would trust the engineers at Cobra, Midland, or whatever, to know what they were doing when they designed the radio long before I would trust some "radio expert" sitting in his garage offering radio modifications at a cheap price.

That "radio expert" would have to CONVINCE me that he knows more before I would let him touch my radio to make modifications.

Perhaps your message is a joke, Steve (hopefully). However, no, it is not legal to use a marine radio on land. Unauthorized operation of marine radio equipment could result in criminal fines of up to $100,000, or imprisonment, for a first-time offense. If the unauthorized operation of a marine radio results in injury or loss of life, the immediate result would be serious criminal charges in a federal court.

There are many bodies of water in Kansas, Steve, where boaters, both private and commercial, depend on marine radio as their only link to help in an emergency. Please don't put these people in potential danger by the illegal use of a marine radio.

I cannot think of a single place in this country (except perhaps parts
of Nevada) where a person would be far enough from a body of water to
safely operate a marine radio without the possibility of interferring
with an authorized user.

Marine radio is not just used by commercial ships, Bob. Private boat
owners, all over the country, use marine radio to communicate. And,
where there are boaters in large numbers, there are marine rescue
personnel that use marine radio for their operations.

With that in mind, and judging from how much effort both the FCC and
Coast Guard expend to track down unauthorized users, I find it hard to
believe that the FCC would make a statement like that (officially or unofficially).

Yep... I had a cobra 2000 completely modified professionally
and was always on frequency. BUT it was hard to have a croup
conversation because there was always a few who were 200 to
300 Hz off. You constarlly had to have your hands on the
clarifer twisting it for each station! Then if you forgot to
put it back then the others asked to retune and resend.
Cheers,
John

The solution you present is not viable, as the is not ONE body panel on this creation that is metal.
I know I need an antenna that works w/o using the body for a ground plane.
From past experience, I know the thru-glass designs are worthless.
What I was hoping for was a little more specific recommendation on mounting location, mount info, and antenna choice.
Thanks anyway.

I was talking with a tech / retail Cobra person in the US
where I bought a 148 GTL. He said he always checked the
radios for alignment.. even the so called better CB's, the
cobras were not all on speck. Most were running well under
legal power, the I F's were out reducing the radios
selectivity and the bands width was to wide leaving room for
more noise on RX and wasted power on TX.

I later bought another 148 GTL of the shelf back here in
Canada.. There is a very noticeable difference in signal to
noise and clarity on both TX and RX.
just my 2 cents
Cheers,
John

Dwight:

A couple of months back this issue came up on another newsgroup, a fellow claimed that the FCC authorized marine VHF equipment to be used inland for non-maritime/non-waterways use on a non-interference basis---easy to do with FM mode (capture effect). Of course, I had to jump in and ask for official support for his claims---he directed me to a statement issued by the FCC on their web site---sorry, I don't have that link anymore but they do allow it.

Of course, if folks get rowdy with it's use and abuse emergency channels and the service in general I suspect they will be penalized---and quick! Marine VHF is so easy to locate especially with all the VHF direction finding equipment that is available to the civilian boater.

670. "This Is Our Brain On Drugs" or DUHhhhhhhh.....My Brain....."Which Way Did It go"????.....

Newsgroup: rec.radio.cb
Date: 2000-01-06 00:00:00 UTC
From: kcaj_south@yahoo.com
Message-ID: <8533en$h0f$1@nnrp1.deja.com>
Source record: 18519

This is another fantastic article from the The Spotlight, Page 2, January 3-10. Published by Liberty Lobby, 300 Independence Ave S.E., Washington. D.C.---20003 http://www.spotlight.org
Liberty Lobby is America's oldest American First/Patriot lobbying organization in Washington D.C. 45 years and still growing strong!

You just don't realize how good it is to be able to read the truth! I consider The Spotlight to be my premiere source of truthful information
about the political scene in America (and many other areas of interest) and the rest of the world. They have never let me down! They
have always proven to be the number one source of information that you
won't generally get through the controlled and dominated news mediums and other media and journalistic
sources. Made factually evident by some of the most professional journalism available anywhere. The Spotlight doesn't cater to or necessarily endorse the mainstream Republican or Democrat viewpoints. They are populist-based and make political decisions and other views strictly based on the populistic will of the American peoples. American-First at it's finest!

DISAPPEARING DRUGS

According to a General Accounting office (GOA) report, 28 percent of drugs seized as evidence by the Drug Enforcement Administration (DEA) have been mysteriously disappearing from four federal laboratories in Dallas, Miami, New York and San Diego. Of the 142 items weighed by GAO
investigators, 40 were off more than five grams. "The inaccurate recording of drug weights decreases DEA'S accountability over such evidence," the GAO reported.

********** I personally did a further search on the official United States Department of Justice Drug Enforcement Administration homepage. Acording to official 1998 D.E.A. drug seizure statistics, the D.E.A. seized the following amounts of drugs in this order, in Kilo's (2.2 pounds).

1. Heroin (D.E.A.) 364.2
Heroin (CO-OP) 260.4 HEROIN (TOTAL) 626.6

2. Cocaine (D.E.A.) 31,648.8
Cocaine (CO-OP) 38,792.1 COCAINE (TOTAL) 70,440.9

3. Cannabis (D.E.A.) 239,514.6
Cannabis (CO-OP) 124,566.5 CANNABIS (TOTAL) 364,081.1

4. Meth (D.E.A.) 1,217.4
Meth (CO-OP) 1,351.1 METH (TOTAL) 3,568.5

Without even trying to itemize prices per individual pound, which I don't know the street prices and not wanting to go to hightimes.com or somewhere else like this, this adds to approximately 438,717.1 kilos of illegal drugs the D.E.A. claimed to have seized in 1998. This equals approximately 965,177.62 U.S. pounds. At say $1,000 a
pound (which is not even realistic), you have over $270,000,000 but this figure on the street would easily run into the many U.S. $Billions.

This G.A.O. report is talking about four federal laboratories that give
an account of a smaller amount of the whole amount confiscated and nobody has an accurate ability to determine exactly how much of the confiscated illegal drugs are actually missing from everywhere else including other government agencies. At the 28 percent scale, approximately as much as 270,249.73 pounds of drugs that were actually
reported as confiscated could be "missing" and there could be many more
pounds that weren't accounted for.

671. Re: Amateur Restructuring Announcement - RESULTS?

Newsgroup: rec.radio.cb
Date: 2000-01-06 00:00:00 UTC
From: "T. Smith" <nospam@nospam.com>
Message-ID: <3874A0B3.52A6@nospam.com>
Source record: 18520
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.cb,rec.radio.scanner,rec.radio.shortwave

What results will restructuring have, what questions will be raised?

1. Where will all those antennas be erected now that zoning laws are a matter of fact in practically all communities and housing developments across the US. Will amateur antenna erection issues be subject to Supreme Court review and rulings.

2. Will the expected rantings and ravings of a hoard of cb'ers propagated world wide on the HF bands at the eleven year sunspot maxima make citizens and governing bodies of the US appear as chumps and cause a loss of face in the global community.

3. With the expected increase of operators will the FCC impose a reduce power limit so as to maintain appropriate RF field intensities in areas of human habitation---for the children.

4. Statistically speaking, will the increase of illegal activites that will accompany the increased population of amateurs be managable by the FCC---if they can't afford (funding, manpower) to manages the mess that they created what then.

5. What restrictions in advanced design of amateur equipment will be imposed now that manufacturers have been stimulated to produce by the creation of larger market demand.

6. Will amateur radio disappear into the 'noise' by a future FCC Report and Order that all amateur activities cease and desist and resort to channelized control of spread-spectrum modulation techniques to hide and get rid of the dirty little mess. Pass codes will be issued instead of callsigns to activate strictly regulated (FCC) communicators (ex-tranceivers).

7. Will all amateur HF allocations be eliminated and relocated to spectrum translators aboard amateur satellites operating at milimeter wavelengts.

8. Will amateur equipment contain embedded identifiers and GPS locators to control errant amateurs---computer databasing and issuance by violation notices by FCC or ARRL Official Observer staff (by FCC approval) at the mere push of a button by decoding an encrypted data burst piggy-backed with amateur transmissions.

9. Will we tire of 'smokey' reports from one end of the continent to another.

10. To ease congestion, will amateur VFO's (slyda's or sliders) be eventually outlawed and be replaced by channel selectors.

11. Will older amateur equipment at some future date be outlawed as the transition to controlled radio communications is established.

12. After April, 2000 will we find that an obtaining and possessing an amateur license from some third world country (like Somalia) where testing is more rigorous convey greater prestige to it's holder than to be licensed in the US.

13. To Be Continued...

That is the purpose of the claifier, it is only luck if the other station's transmit frequency is exactly the same as yours, so you use the clarifier to tune him in. And even if every station was on the exact same frequency, someone will retune slightly to make the signal sound to their liking. If the transmit freq is tied to the receive freq, then they have just changed their transmit frequency. Then when he transmits, he dosen't sound the same to someone else, so they retune him, and quess what? now his transmit frequency has changed also.

679. Need info on Kenwood TS570SG!

Newsgroup: rec.radio.cb
Date: 2000-01-06 00:00:00 UTC
From: rpemers@aol.com
Message-ID: <20000106103737.19673.00000050@ng-fl1.aol.com>
Source record: 18528

Hi,

I need the MARS/CAP mod for the TS570SG in order to be able to drive my Ten Tec 2 meter transverter to cover the entire 2 meter band. The rig has to transmit 28.000 - 32.000MHz to do cover it. Kenwood will not release the info. Without opening up the radio I only have 144-145.700 2 meter coverage. NOTE: I have seen the mod listed on QRZ and another site for the TS570D and DG models and they are completely diferent mods, so this needs to be specific to the TS570SG model.

Thanks!

Ron

680. Re: Amplified mics

Newsgroup: rec.radio.cb
Date: 2000-01-06 00:00:00 UTC
From: Mike Yetsko <joe@user.com>
Message-ID: <852cq0$hg8$1@ash.prod.itd.earthlink.net>
Source record: 18529

Well, I know this will ruffle a few feathers, but noise canceling mics are not a crock, as stated elsewhere. First off, you get what you pay for, and secondly, you don't get something for nothing. If you think they are a crock, you haven't really looked into them.

Nouse canceling is done three ways. One is mechanically. This can take advantage of 'proximity effect' or other characteristics of a mic to limit what it picks up. Some airplane mics are this way, even having a 'lip bar' on the mic to let the pilot FEEL the mic against his lips with the mic a fraction of an inch away.

Yeah, they work, but the better ones are quite pricey.

Electronic mics work two ways. In one case there are TWO mic elements. One facing the user where he speaks, one pulling in all kinds of external noise but MUCH LESS of the user. The idea is to 'subtract' the generic mic noise from the user mic signal. Generic noise will be on both mics, the user will be mostly on one.

RS used to sell a mic that didn't have any active circuitry, just two mics wired 'out of phase' for this. It sorta worked, but sounded muddy. It didn't last long.

With active electronics the signal can be cleaned up and the 'tone' tailored to make it sound quite good. Some mics are better at this than others.

Finally, there are mics that use 'companders'. Basically what they do is set a 'threshold' and anything below that gets 'muted'. Anything above that gets through. Doing this 'actively' and 'fast', like Dolby does for tape, can have some decent results, but you won't find this in consumer grade mics.

Does this stuff work? Well, to various degrees, and is dependant on the situation and type of noise. If you have a specific situation your are trying to tackle, TRY a mic first, or at least make sure you have return privlidges. You might be surprise at what mics work better than others in your situation.

A D104? When you're asking about a noise canceling mic?

Now THAT'S a crock!!

Mike

Message-ID: <852d40$i14$1@ash.prod.itd.earthlink.net>
Source record: 18530

The only thing that is 'official' is that Channel 9 is reserved for
'motorist assistance'. (It is NOT emergency as most people
assume incorrectly.)

Emergencies can be taken care of anywhere, of course.

Other than that, nothing is 'official', but there are some
'conventions' over the years.

Highway used to be channel 11, but moved to Channel 19 in
the 70's. For a while the truckers tried to get 19 for East/West
and 17 for North/South, but that never took off.

Channel 16 was grabbed by SSB for a long time. With 40
channel SSB use moved to 32-35 for a while. Now they
seem to be fighting a loosing battle trying to grab 35-40.
But with AM people just going 'top of the dial' I don't think
they'll ever win.

In a lot of areas of the country there still is 'weather' activity
on channel 13. That was pretty popular for a while in the
70's, but again, it seems to have fallen into disuse.

And for the longest time, most single channel HTs came
with channel 14, so it sorta became the 'toy' channel.

And also realize there is a lot of 'local' conventions for
groups on specific channels, way too numerous to list
here.

No, I did NOT say that anyone that does not share *MY* personal views is
an old fart. I said that anyone not willing to be open minded, tolerant
and non-prejudicial, was an "old fart" Maybe I used the wrong word.
Maybe I should have just said "Bigot". Look up the definition, and then
```

try to tell me that many of these guys (including you it seems) do not
fit the definition. And THEN tell me that I'm "arrogant". If the truth
hurts that much, maybe you should re-evaluate your point of view.

Bummer! The world is full of people that may not agree with your view of
things. I see it as you have 2 choices. Accept, tolerate, and
understand, or stick your head in the sand and be miseable. Which will
it be?

As to liking me or not, that is your choice as well. I certainly won't
lose sleep over it. As for tolerating me, well, as long as you continue
to read, you'll have to tolerate me, and others, who don't share your
views. That's life. Since your arguments thusfar have been based on
opinion and emotion, you cannot "win" the debate. If you'd like to
debate this on a factual basis, I'd be up for the challenge.

> isn't prejudiced or of who should stay and who should leave amateur
> radio (leaving more room for the "rest of us").

I never implied that I was the all mighty "arbiter". The prejudice is
blatently obvious in those who will not tolerate others' activities,
simply because they don't fit into their own narrow viewpoints. Don't
shoot me for being the messenger. I only speak what I see. Because you

refuse to see it, or try to rationalize it any number of ways, does not
mean that it isn't there. If it walks like a duck, swims like a duck,
and quacks like a duck, it certainly ain't no chicken...

Whether or not someone "throws in the towel" or not is their own choice.
Personally, I'd rather see them leave the hobby in disgust rather than
have to put up with their pompous, arrogant, superior egos, on the
bands. That type of grandstanding does nothing good for the hobby. Get
over it, move on, or move out. Simple as that.

That's up to you. Stay if you want, but don't preach to the newcomers
how much "better" you are simply because you mastered an obsolete
telegraphy skill. It won't mean much to the guy designing digital audio
compression algorithms.

>
> > Bottom line: your opinion is irrelevant. The law is the law.

The regs say that new hams need only pass 5 WPM to become licensed for
the whole anchilada. Therefore by extension, whether or not you believe
that they are "real" hams or not is irrelevant. It's not up to me to
decide it. The FCC already has.

>

Whoopie! That and buck will get you a cup of coffee and 2 hot dogs at the local mini-mart. It's a shame that all that testing and code skill haven't taught you to be more accepting of differing viewpoints.

> I've never settled for mediocre in anything I've wanted to do in this life
> and I've never asked for anyone to make something easier for me because
> I couldn't handle it.

And if everyone thought like you, we'd still be shoeing horses, lighting flares at intersections, when we cross, as well as doing a lot of obsolete things. At some point, the rules have to change to track with improvements in technology. At some point, we have to acknowlege that morse telegraphy is just as old and obsolete as horses and buggies. So at what point do we finally stop testing for it? Do we dogmatically continue to test for CW into the 24th century when people are Star Trekking around the galaxy? No one is demanding "easier access" to ham radio, just access that is more in line with the technology of TODAY. You can give me the toughest theory exam that is relevant and I'll study for and pass it, because that is what is required TODAY.

I am a man of principles. I just couldn't see the relavance of CW. I refused to allocate slots of my precious time, to learning a skill that was of NO use or value to me. I had a choice. I could either give in, and waste time learning it,for no reason other than to get over a "hurdle", or be satisfied with technician plus privileges. For 18 years I have been satisfied. I knew that this day would come eventually. Now it's here. All I can say is "it's about time!"

It's unfortunate that the FCC didn't revamp the theory tests. They are way too easy now. I passed all of the current the internet sample tests without even studying them first. But it seems that the FCC is mostly interested in making their administrative jobs easier.....

It's not that. It is true that technology has changed, and has gotten
better, but at the same time, more difficult to troubleshoot and repair.
I don't think that anyone would fault a person, who is technically
proficient at TODAY'S technology. I would LOVE it if there were MORE
guys like that around. The PROBLEM is that many (most) newer hams are
not proficient at ANY technology. You don't have to be a techno-whiz to
be a user, and that's what most guys are these days.

It's true that homebrew rigs could not hold a candle to what the "big 3"
from Japan can mass produce, but there are many things that could be
"invented" to interface with, connect to, amplify, convert, transvert,
digitize, etc., that the technically adept should be able to master. It
just doesn't seem to be happening in all but a few small circles.

Lets keep the technical aspect of ham radio alive. THAT is what makes us
special.

Ah! the old argument, should we compromise the QUALITY of the ham,
simply to increase the QUANTITY of hams?

We have a radio service that appeals to a much broader range of people,
and not necessarily technically adept. It's called CB. CB is a prime
example of what happens when you let the general public "play radio",
sans any testing.

I would rather keep a technical bent on ham radio so that (hopefully)
the people that remain tend to be more civilized, and less likely to
turn ham radio into a larger extension of 75 meters, or channel 19.

That radio was manufactured in the 70's, so it's at least 25 years old.
It stands to reason that the filter caps in the power supply have dried
out and lost value. Take a large value electrolytic cap and parallel it
across the one that is in there, and see if that doesn't cure your

problem.

The really bad news is that there are undoubtedly other electrolytic caps that have changed value, so you may experience other "anomalies".

>
> Sincerely

A long time ago (when there were only 23 channels) there were some assigned channels. The only channels that you could talk to other stations other than your licensed ones, were channels 10-15 and 23. Channel 11 was a "calling channel" and 9 was for emergencies.

Later on this plan was abolished (except for channel 9). We have had some "gentleman's agreement" assignments since then though. Channels 16, 36-40 were considered SSB channels. Channel 19 (formerly 10 east of the mississippi) is the truckers/road travelers channel. Channel 13, in some areas is for boat traffic.

There may be other "region specific" assigments. Nowadays, people have a "If I can dial it in, I can use it" attitude, so most of those gentleman's agreemants are largely ignored...

I'll say nonsense here.

There IS no one single solution, other than two staged controls,
which I doubt you'll ever see.

If it is just two people, then a fixed transmit with a variable receive
is the best 'simple' solution.

But this quickly falls apart when there are 'groups' with multiple
people. In that case, the best 'simple' solution is to have
tx/rx tracking (the 'unlocked clarifier' mod) so that everybody
can 'get together'. However this is VERY dependant on everybody
having a rig that is CORRECTLY adjusted and 'tracking'.

The BEST overall solution is something that you won't see on CBs,
as it is illegal (and yes, I know the 'unlocked clarifier' is also
illegal,
but unnoticeable if done right). That would be for for a RX tuner
that tracks BOTH RX and TX, and then a separate RX control to
drag your receiver away from you transmitter. Can you say "RIT"?
The reason it won't be on CBs is that CB is 'channelized' by
definition, and manufactures won't be putting on controls that
aren't allowed to be there in the first place.

The arguement over how to do this is moot, as no matter what, it's
a compromise due to regulatory requirements.

if everyone just ran there radio's on center slot for TX AND RX this would not be a problem,but many people dont have radio's that are "dead on" in TX or RX,either becaue they tinkered with it or it came from the factory with an off-set in,so if you want to talk to a few stations on ssb you need to constantly tune back and forth with the clarifier,in most HF rigs,the RX and TX can be tuned seperatly,which in the end is the best of both worlds.....to bad we all cant afford one.

Even if you had ten stations and all were exactly on the same frequency, someone would retune on receive because they want to make the ssb signal more clear to them. Now if their tx and rx are locked together, then he has just changed his transmit frequency and now everyone will retune to him, which means they have all changed their transmit frequency, then he retunes and they retune and so on and so on. Never mind that all are not on the exact same frequency, just use the clarifier to retune the received signal to your liking, even if you have to retune each station. Most of the time it is only one or two stations you have to clarify anyway.

>Other than an initial chase, when multilple radios have unlocked
>clarifiers there would never, within reason, be a need to move again.

Why is there even an INITIAL chase? If you tune someone in, so that the voice sounds normal, with your VFO (NOT channel selector), you SHOULD be transmitting and recieving on EXACTLY the same frequency as the other station.... at that point, if you prefer a slightly different sounding audio, YOU would use your clarifier/RIT (receiver incremental tuning) to make the received station sound as you desire... It shouldn't take a rocket scientist to figure out that, if at this point you also move your transmit frequency, the game starts all over again.

>If you have ever gotten into a conversation with multiple (more than
>one) non unlocked radios then you would know that in the real world
>your method is impossible with a fixed transmit.

Is that so.......... perhaps you'd better tune around the HF bands a bit more and do some listening. ...Do you know what a Net is??....... I routinely check into HF SSB Nets where as many as 50 (or more) different SSB stations meet on ONE frequency.

The only reason for an "unlocked clarifier" (what you called one that changes the xmit and recv freq) is to make a "Channel Bound" (no VFO) radio be able to change frequency and go BETWEEN channels. A far better solution is to get rid of the "Channel Bound" rig and purchase a radio with a VFO, which allows you to move anywhere... if the rig has a VFO, "unlocking" the clarifier/RIT defeats the entire purpose of the VFO.

Not exactly home brew, Dave, but you should check out the Elecraft K2
kit at

http://www.elecraft.com/

I've built one and it does "hold a candle" to the Big-3 radios.

My little brother has recently turned me on to the world of CBs. I have been looking around on the internet for as much information as I can get. I was thinking about getting a Cobra 29 Sound Tracker, but some posts have said they stink.

I was wondering if anyone could help me out on telling me what is a good setup for myself. I drive a 93 Ford Ranger if that even matters I don't know.

Also, is there a good place on the net that I can buy good used or refurbished stuff?

Thanks.

What sounds normal is different to different people. To me, another
station may sound normal if I tune a few Hz higher or lower off his
transmit frequency, some people like a higher pitch, some a lower pitch.
If the rx and tx are locked then my transmit frequency has now changed
by that amount and I don't sound normal to the other station(s).

--> That'd be silly. It's exactly those millimeter wavelengths that commercial interests are coveting. HF isn't used much in commercial communications, with a few exceptions -- the only interest most companies have in the HF bands is how much trash their electronic-ballasted fluorescent lamps are allowed to dump there.

I had a K40 trunk mount on a car I used to have. It was a great antenna.
Some people don't use them because of their power handling capability. They
are rated at 500 watts. Other makers build antennas that will habdle more
power. In the mobile, I've never ran over about 200 watts. Thae base is
another story though.....Tom

>anyway.

You make this so complex. It is not. You should stick to AM if you
can't hear the odd harmonics developed when you are off frequency
from another station. You should be able, regardless if you ever
heard the person before, to get within 50 hertz of them. If you can
get within 50, and if the others can also get within 50, and if you
are capable of aligning your RX to your TX, then there are no problems
with running SSB. If you can't do that then you should stick to AM
because your locked transmit suggestion does not fly with multiple
operators.

721. Penetrator 500 Spec's

Newsgroup: rec.radio.cb
Date: 2000-01-06 00:00:00 UTC
From: Jay <jay123a@qnet.com>
Message-ID: <3874CF3A.4D16DD13@qnet.com>
Source record: 18570

Hello RacerX: Ok you ask for it:

Here are the 3 modern Penetrator 500 measurements.

P/N 800290 Believed to be the first version, made to work on the center
of the 23 channel CB band which is 27.11MHZ.
Vertical element lengths:
1 1/4" = 77 inches
1 1/8" = 55 inches, 52 1/8 inches exposed. Swedged reduced to 7/8.
7/8" = 48 inches, 45 1/2 inches exposed. Swedged reduced to 5/8.
5/8" = 48 inches, 45 1/2 inches exposed. Swedged reduced to 7/16.
7/16" = 52 1/8 inches, 50 inches exposed
Total length from the top of the 1 1/4 element = 193 1/8"

P/N 801090 Second version 23 channel, allowed the manufacture to make 2
Penetrator 500 antennas from one length of 1 1/4" tubing, at 144" long.
1 1/4" = 71 inches
1 1/8" = 55 inches, 52 1/8 inches exposed. Swedged reduced to 7/8
7/8" = 55 inches, 52 1/2 inches exposed. Swedged reduced to 5/8
5/8" = 47 inches, 44 1/2 inches exposed, Swedged reduced to 7/16
7/16" = 52 1/8 inches, 50 inches exposed
Total length from the top of the 1 1/4 element = 199 1/8"

P/N Latest and greatest. Made 3 inches shorter to have a good SWR on the
upper, new 40 channels.
1 1/4" = 71 inches
1 1/8" = 55 inches, 52 1/8 inches exposed, Swedged reduced to 7/8
7/8" = 52 inches, 49 3/8 inches exposed, Swedged reduced to 5/8
5/8" = 47 inches, 44 1/2 inches exposed, Swedged reduced to 7/16
7/16" = 52 1/8 inches, 50 inches exposed
Total length from the top of the 1 1/4 element = 196"

All modern models have the same ground radial length, they are:
7/8" = 24 inches, Swedged reduced to 5/8
5/8" = 33 1/2 inches, 31 inches exposed, Swedged reduced to 7/16
7/16" = 52 inches, 50 inches exposed.
Total length from tip to tip is 105 inches

If you make the antenna to the total length of 196" from the top of the
1 1/4 vertical element (if its the 71 inch length one) this will work
for all 40 channels, just a little better than the original, first two.

Or for any of the antennas, verify a length from the top of the ground
radial mounting bracket to the top of the antenna of 256.5 inches.

The place to adjust the antennas length, making it shorter, is where the
1 1/8 tubing fits into the 1 1/4" vertical element.

Hope this helps ya out!

Jay in the Mojave

There are definately many local agreements...I'll give ya the agreement for
my area
3 log trucks dirt road
5 logging heavy equipment dirt road
6 regulus stud mill
7 local bs channel
9 sheriff's office
10 chip trucks
16 potlatch mill log yard
19 highway and the local radio club
20 potlatch mill guard shack
38, 39 ssb

I believe solarcon amkes an antenna that is supposed to work without a ground plane. I've never used the antenna, as there is plent y of metal in my '74 ford truck. I've seen it in the copper electronics catalog. I can't give any advice on doing business with copper as I have never had any experience with that either. Coaxkid's Left Coast Radio may have the antenna, I've done quita a bit of business with them in the past and have always been pleased. Tom

Body handling: HTML body converted to readable text

Listen to Tim.

I'd also recommend you avoid this tech in the future.

A properly functioning limiter (please note the inclusion
of the word 'properly') can make you actually sound
much louder than an 'open' circuit. While the peaks
would be less, your signal would be much more dense,
and as a result have a LOT more 'punch'.

If your rig has a crappy design for a limiter, then it may
appear to be better without it, but I REALLY doubt that.

Years ago, when 40 channel first came out, everyone was
complaining about the 'cut back' in power which was no
such thing. I picked up a Radio Shack TRC-152, which was
a 23 channel version of the 'next model' TRC-452 for
40 channel. I put the switches on it of course, and when the
452 came out, ordered the 40 channel knob and other parts
and made it a 40 channel radio.

ANYWAY... I set it up on a scope, the RIGHT way. Setting
up a trapiziod. Set up right this will give the 'densest' linear
sweep display. It also gives the loudest apparant signal.
Well, it turned out I could get the best trapizoid by backing
off the power to just over 3W. Now it was full, and sounded
louder than anyone of my friends, and was still clean with
no apparant splatter.

When the TRC-449 SSB radio came out, I wanted that, and
picked it up immediately, and had a guy bugging me for my
old '152'. I offered him a NEW 452 that I could set up the
same way. Nope! He wanted THAT 152 because he had
heard it on the air.

There's lots of guys who will basically sell you SH*T, but it's like
Kaufman, pulling mind games on people who don't know any
better.

Clean power is better than dirty power, and punch is the best
of all!

Mike

I have no problem with a RIT as long as you can initially tie tx and
rx together first.

>>If you have ever gotten into a conversation with multiple (more than
>>one) non unlocked radios then you would know that in the real world
>>your method is impossible with a fixed transmit.

>more and do some listening. ...Do you know what a Net is??....... I
>routinely check into HF SSB Nets where as many as 50 (or more) different SSB
>stations meet on ONE frequency.

I've been doing this for twenty years. The overwhelming majority of
the time these radios are operated "unlocked' or with the tx/rx tied
and movable. The normal reason for the infrequent use of the RIT
control is because someone is using a boat anchor and they can't align
their tx to rx. So you do it on your end. This is NOT the norm. Most
all amateur transceivers in a roundtable are tied and movable. Most
all amateur transceivers can be docked onto a frequency readout and
be much more accurate than a CB readout.

>The only reason for an "unlocked clarifier" (what you called one that
>changes the xmit and recv freq) is to make a "Channel Bound" (no VFO) radio

>clarifier/RIT defeats the entire purpose of the VFO.

That is not the only reason. I agree on the purchase of a VFO radio.

You have conveniently ignored a solution to multiple ssb
stations using a fixed TX. The only solution is a movable
TX.

Dispute that.

I am considering purchasing one of the following radio's:

Uniden Grant ST,

Midland 79-290,

Cobra 148GTL ST,

Galaxy DX-959.

What are your opinions on these radio's?

Are there any other I should consider?

Thanks for any info.

That's right!! You'll be able to tell them from the old idiots who
persist in bad-mouthing any newbie who doesn't 'fall in line'
with what they 'had to do' to earn their wings.

Sorta reminds me of the old farts who sat around when I was
a kid telling old WWII stories about how they each won the war.

Just as pathetic, and just as pointless.

The real shame is there will be a few of the newbies who will be
mesmerized by the old farts, and become one...

I have no problem with RITcontrols. However it is of primary
importance to have the ability to tie tx and rx together and be able
to move them. Everything beyond that is secondary.

But theres no DX allowed on this band. So, a no code HF band that
required a written license would be nice. I don't think that
eliminating the 5WPM requirement will introduce a bunch of riff-raff.
After all, learning the 5WPM is really just a waste of time. I'd
rather use that time to study more radio theory than to learn a code
that has no bearing in science at all. Its just a code.

First off it's the ARRL not AARL.The freqs you mentioned are already
alocated and there are other CB type bands like GMRS,FRS,etc.Why don't
you go there? The ARRL can't even represent it's membership,don't expect
them to support you.

So many replies, so much BS. Strickly speaking, No they are not legal fro land use. HOWEVER, be aware that some of the Frequency pairs on the marine radio band may be re-farmed (meaning used by others) away from maritime traffic areas such as the Gulf of Mexico, Mississippi Water way, Great Lakes etc., so you may end up tranmitting on something your local sheriff or somebody else uses. As proposed by others, GMRS or FRS radios may be the way to go. You could check out getting a Ham License.
Best wishes, Martin

>Hmm, so your saying that every radio that has their Tx/Rx tied
>together will always be perfectly aligned with each other?

Yes. If the mod was done PROPERLY then Tx would be dead nuts with RX. This is not hard to do.Then if you are capable you can by ear align yourself to a stations transmission. You should easily be able to get within 50 hertz by ear even if you never heard the person before. If you can't then go back to AM because sideband is not for you. If you can then automatically your transmit moves with you, and it is also within 50 hertz. Any number of radios with this mod can join in and automatically be within 50 hertz just by twisting their clarifier one time. How easy can it get?

You can not do this with a fixed transmit and multiple users. The transmit frequency difference of multiple radios prevent a "everybody on one freq" occurrence. When this happens the tendency is to re-adjust your clarifier every time a new person keys up.

WHY?.......because every person is on a different frequency.

>If their not, then what do you do? Just forget about talking to that
>person?

You should.. The unlocked clarifier is easy to do, easy to operate and it is accurate if you do it correctly. If a person can't bring their transmit to me with a degree of accuracy then he is showing his ignorance of what SSB is. SSB must be frequency aligned. The best and easiest way is to do this with your ears. A unlocked clarifier accomplishes this. No stock CB can.

http://www.fcc.gov/Bureaus/Wireless/News_Releases/1998/nrwl8028.txt

Report No. DC 95-75 ACTION IN DOCKET CASE May 26,
1995

FCC AUTHORIZES PRIVATE LAND MOBILE SHARING OF CERTAIN MARITIME
VHF FREQUENCIES; RECLASSIFIES INTERNATIONAL PUBLIC COAST
STATIONS AS NON-DOMINANT COMMON CARRIERS
(PR DOCKET NO. 92-257)

The Commission has amended its rules to authorize private
land mobile sharing of certain maritime VHF frequencies, and to
reclassify international public coast stations as non-dominant
common carriers. These changes will allow use of certain marine
VHF channels in land-locked areas, far from navigable waters,
and streamline the regulatory procedures for public coast
stations.

The amended rules will permit private land mobile eligibles
in the Industrial and Land Transportation (I/LT) radio services
to share marine VHF public correspondence channels 24-28 and 84-
87 on a primary basis within the 48 contiguous states far from
navigable waterways and existing VHF public coast stations. The
amended rules set forth minimum separation guidelines, requiring
I/LT eligibles to be located at least 116 km (72 miles) to 187 km
(116 miles) from existing public coast stations and navigable
waters, depending on station power and antenna height.
Additionally, the Commission will allow sharing of these channels
on a secondary, non-interference basis in areas near navigable
waterways, but far from VHF public coast stations. The
Commission stated that I/LT applications for sharing this
spectrum must be coordinated by the frequency coordinator
certified by the FCC for their particular radio service.

Also by this action, the Commission determined that
reclassifying international public coast stations as non-dominant
common carriers will serve the public interest by promoting
competition. Currently, public coast stations face competition
from many telecommunications mediums, including cellular
telephone and satellite communications. Further, the Commission
noted that the advantages of increased competition coupled with
the threat of potential Commission action and the difficulty of
concealing anti-competitive practices, are sufficient to deter
unfair competitive practices in the public coast station market.
Thus, international public coast stations will now be treated
under streamlined regulatory procedures.

(over)

I've had a wilson 1000 and someone messed it, and the roof of my car up trying to steal it. the coax was pretty stretched out and cut up so I went to a trunk mount, which is a K40. the k40 was the only trunk mount that i could find and it worked out good for me because i was able to remove the antenna and put it in my trunk.
I have recently got a fullsize van and purchased
a magnet mount for the k40 and since then I dont see any diference between the two.
they are both really great antennas and i wouldnt kick either one out of bed for eating crackers.

<dmbrodbe@mtu.edu> wrote:

Don't underestimate how quickly/cheaply devices can be produced. Take
the Direct Broadcast system for example. Inexpensive was they key; they
ended up with a stamped metal dish and a $35 LNB (net cost). You can
still spend a few hundred on an LNB for TVRO, yet one for DSS is a tenth
of that to manufacture.

Money comes from other areas as well; just because the GPS capability
costs aren't absorbed by the end user doesn't mean production costs
haven't been offset elsewhere. Some group like Motorola could step in
with their "Jupiter" chipset and agree to produce a
cellphone-integrateable circuit for very little so long as certain
advertising agreements are adhered to. (ie: 'Motorola' printed on most
every phone out there, despite who made it).

Also, when you are talking about something as expansive as the
cell-phone market (I read there are more of them installed than TV's!
Projections claim that there will be 3 cell-phones per TV by 2005).
Individual unit production cost drops sharply when you are producing
millions and millions of them. Personal GPS's just aren't selling in
these numbers.

Just my .02 worth of banter...
73

> --> Well, cell phones are about to. I'm still wondering how

And I would guess the vast majority of "old" HAMs wouldn't know what they
were looking at if they were able to get the covers off their latest
appliance. I have noticed very, very few technical wizzards amongst the
established HAMs. Wonder how many could still pass the advanced and extra
written tests? Most that are technically adept have the ability due to it
being their profession and are much younger than the average HAM.

Hey guys
I got a CDE Mark 17 CB Mobile radio that is new in the box that also comes with another box that has an extension cable for the mike.This unit is the one that goes under the seat or in the trunk.It has never been used,it has all the stuff with it.I have no idea what this may be worth.It is made by the Cornel Dubilier Co.
I want to sell to serious offer.You won't be disapointed.So make me a fair offer.
Thanks
I can be reached at :
n1rsp@qsl.net
Tel:978-281-3359
ICQ # 423512

No, the roof is NOT metal.
There are NO metal body panels anywhere on this.
Get a magnet and check one out yourselves- all the 1990 Olds silhouette,
Chevy Lumina APV, Pontiac Trans Vans, etc are the same. There is a band
running across the top that looks like steel, but is is plastic.
At least the thing won't rust.
Thanks anyway to all who offered advice.

Actually,

If you buy the graphite anode tubes, they are a very close duplicate of the
Amperex, which was a better tube than the Eimac.

They are rated at 4Kv on the plate.

To minimize the chance of parasitics, run about 3500 to 3700 on them.

I have put slightly over 5K on the plates before, though.

Get yourself a 2800 VAC at 1A CCS transformer and you should be fine. Use a minimum of 32 uF of capacitance in the power supply, and good, quality diodes in the power supply.

Either of them need a simple mod, though.

You need to take the bias voltage and rewire it using another cap and diode
to act as a voltage doubler, rather than a bridge.

The tubes will break into self oscillation when replaced with new tubes...
The FL-2100s bias the tubes JUST into cutoff, so this is money well spent.

I agree. Using the Internet is fairly easy. But understanding how it
works isn't. Doing something other than using various client apps, such
as setting up a server, creating CGI scripts, developing Web apps and
the like are far harder than getting any ham ticket and going out and
buying the lastest Yeawooodcom radio and getting on the air.

But Java has nothing directly to do with the Internet. It is a
programming language. It can be used via the Internet or not, just like
many other programming languages. You're far more likely to encounter
Perl on the Internet than Java.

Dwight, see Popeyes' post. And loosen up the sphincter son. I don't see the real harm in it as these guys will most likely be using Handhelds with limited range in the first place. They will be in the woods most of the time and this will cut the range considerably more. I can agree with someone suggesting the FRS stuff but if you have the marine radios already, why spend more money?

Why does it concern so many Ham operators whom does what in the freeband ?????? You hear a big share of the same voices on 10 and 80 meters as the freeband !!!!! Like free speech, hhhhmmmm global networks without the governments control, hhhmmm,people having a good time and enjoying a hobby,BFD, like mind your own business , or do your own thing , or go practice your f--king code, you ought to see the looks you get at the local ham club when you tell them that you belong to No Code International, kinda like letting a fart in church,

Ever heard of the 6 meter ham band, Tim? It's great for making DX
contacts when the conditions are right. Two meters, where most
repeaters are located, is better suited for local contacts.

Of course, with the 2 meter repeater links up here in the Pacific
Northwest, reliable local contacts include stations in three States and
parts of British Columbia.

Tied together and moveable doesn't mean squat unless:

1. They are tied together on the same freq. Is yours? Are all the
other guys?

2. The Rx and Tx track identically from full left to full right. I sure
wouldn't bet that precision components were/are used. Same questions
apply here.

3. Same with temperature. And voltage.

Again, if the tx and rx are not on the same frequency across the range
of the clarifer pot and across the temperature (as you mentioned) and
input voltage range, tying together will hurt more than help.

In a perfect world with precision radios and components at a controlled
temp. and input voltage, your idea works great. Otherwise, you'll be
better off tuning your receive to whoever is talking (provided there is

only one keyed at a time %^)). If that is too much work, you might consider AM, where these problems aren't really apparent.

Anyone out there been on SSB with more than one person with a stock CB and fixed transmit? Every radio is a little different and if you clarify on one person, the next guy that transmits is slightly off and you end up tweaking the knob every time someone keys up. The ONLY way to overcome that is unlock the transmit and have the clarifier change the tx and rx together (as long as the radio is set up properly). Maybe Stewart only has one person to talk to and doesn't have this problem.....

>
> Dispute that.

Your solution works just fine when there is a separate conrol to adjust the transmit and recieve - which is how a ham radio is designed. It does not work when the transmit and receive are adjusted with just one control (the "unlocked" clarifier).

Since CB radios do not have the ability to adjust the transmit separately from the receive, the existing system of a unmovable transmit works as it was intended.

See, you're talking about this fantasy world where every radio is perfectly tuned - the radio transmits on the exact spot it is supposed to and the radio receives on the exact spot it is supposed to. Therefore, if the transmit and receive are tied together, both would be on the exact spot they are supposed to be on.

In the real world, CB radios were simply not designed with that level of accuracy. Many CB radios were tuned poorly at the factury. Even if they were tuned perfectly, the relatively inexpensive electronics used in CB's will not be able to keep the radio that perfectly tuned. And the radio slowly goes out of tune as the electronics age. In fact, the tx/rx may even change slightly as the temperature of the radio changes.

Now, the typical ham operator has the skills, and controls on the radio, to slightly adjust his radio to compensate for all of this. Most CB'ers don't develop this level of skill and their radios simply do not have to controls to adjust. In that case, the existing system of a locked transmit is the only effective way to operate a CB on SSB.

Perhaps the more advanced CB operator has the skills to properly adjust his radio to compensate for slight frequency changes, but he is trying to communicate with other operators that are simply not that skilled (nor do they have to controls on the front of their radio to easily adjust).

That is the reality of CB radio, and there is nothing wrong with it. The CB radio service was designed to be used by less skilled people in an informal radio environment. The ability to communicate with friends without worrying about all the fine radio details is one thing that

makes CB radio so attractive to so many people (even to the more advanced operator who occasionally wants to just relax and talk).

Popeye, this applies only to industry and transportation radio services. It does not allow uncoordinated truckers to use a marine radio, and it certainly does not allow individuals on a private hunting trip to use a marine radio.

Bob, this docket case applies only to industry and transportation radio services. It does not allow uncoordinated truckers to use a marine radio, and it certainly does not allow individuals on a private hunting trip to use a marine radio.

As I said before, there are many bodies of water located throughout the United States where boaters, both private and commercial, depend on marine radio as their only link to help in an emergency. Please don't put these people in potential danger by the illegal use of a marine radio.

Sidebanders with the mistaken belief that the stock clarifier
configuration is the best way to go are quickly identified as newbies.
Not that their is anything wrong with being new to SSB, but it is
frustrating that they can't comprehend the value of an unlocked
clarifier.

Contrary to what has been said, the origination of the clarifier mod
was not done to get between channels. When the first radios received
the clarifier mod they did not move very much at all. They usually
moved between 1 and 3 kc's. Hardly any good in getting away from the
noise of the legitimate channel frequency. The clarifier mod was done
to make the radio more useful. It gave the radio the ability to be
used in a roundtable.

There is nothing wrong with a stock clarifier as long as you are
only going to talk to one other radio. However this stock setup was
not well thought out by the rule makers when it comes to roundtables.
The rulemakers only wanted to keep a CB radio channelized. The only
way to do this was to demand that the manufacturers have a locked
transmit frequency. It was not their concern that channelization of
frequency sensitive SSB would make the radios troublesome to
operate. In other words the manufacturers did not come up with the
stock clarifier configuration. Their is no technical advantage to this
type of clarifier setup. It only satisfies the FCC's mandate of
channelization.

It is obvious that SSB is very frequency sensitive. It is also well
known that CB radios are very frequency inaccurate and not very
stable with temperature swings. This combination creates CB radios
that transmit on different frequencies. This is hardly a good
scenario for SSB work when you can't adjust your TX frequency to the
frequency in use, and that is the flaw in channelization of SSB. We do
have a solution though. All we have to do is tie the RX with the TX.
Just adjust your receiver and you automatically adjust your
transmitter. All this without the use of a frequency meter. How
simple can it get.

Obviously not simple enough for everyone.

If they are not then the mod was done incorrectly. It is EASY to tie
them accurately together.

>2. The Rx and Tx track identically from full left to full right. I sure
>wouldn't bet that precision components were/are used. Same questions
>apply here.

The TX and Rx track side by side continuously if the mod is done
correctly. They use the same reference so they have to.

>3. Same with temperature. And voltage.

Who care if you are or are not on the exact frequency of 27.405
As long as everyone has the ability to get on the same frequency then
their is no problem.

807. Hack Job on Conversion (was Re: ssb antenna)

Newsgroup: rec.radio.cb
Date: 2000-01-06 00:00:00 UTC
From: John Amero <" johnaNO§PAM"@island.net>
Message-ID: <38757A70.A13EDE3E@island.net>
Source record: 18656

You can, but I believe we are talking about a hack job where
the average TX and RX is about 5 Khz (1/2 channel) apart
oe so. A good CB has about 60 Db adjacent channel rejection
which is about 7khz to 8khz wide leaving a 2 Khz margin per
10 Mhz channel. On SSB the voice bands width is about 1300
hz or 2300 on AM. That still leaves your voice about 15 BD
down which puts the voice intelligible enough to lock on.
BUT you get a radio that has been hacked like I said above
you have 500,000 - 1300= 488700 or 500,000+ 1300hz= 501,300
out... a number almost 375 times away if you a TX that is
just moving the needle or the QRM is relay high, you are
going to have a hard time talking local even on AM. And a
linear will just screw things up worse even when you watt
meter shows 1000.... of garbage. You are going to have to
slide almost 1/2 channel just to start to clarify the
persian in.
Just my 2 cents plus tax this time <g>
Cheers,
John

Well, as I understand it, a Ham VFO is tied directally to TX
and RX. In the CB it is imedialelly split and a open
clarifire ties then back near the modulator and demodulator,
That means that two sets of IF's have to be precicelly tuned
alike.

The following was sent to me in a e-mail from AES....

New. And the Band is hot!
Ranger RCI-2950DX 12/10M Transceiver
An old favorite now updated with an improved receiver, double FET balanced mixer, surface mount components and improved display lighting. Operate local communications as well as frequent worldwide DX, base or mobile. Participate in club events, emergency communications and more! The unit covers 24.800-24.9900 and 28.0-29.6999MHz with an RF output of 25W on SSB and 10W on CW/AM/FM. The RCI-2950DX also features auto SWR monitor, receiver clarifier, noise blanker/ANL and programmable repeater offset. The unit has a large frequency display with dimmer and an active frequency scanner with 10 programmable frequencies. A frequency selector lockout and PA feature are also included. $249.95

Yes a Wilson does appear to be the better antennae. I really liked mine a Wilson 1000. I purchased the wrong one for my Van and called Wilson about no having the proper whip, they sent me one without change a day later. Even included another key, I did not have to adjust for SWR at all, matched perfectly the first time. Boardcast 50-60 miles in heavy skip to my friend in El Paso from the other side of Las Cruses, New Mexico at the Board Patrol check point. Really great.

Source record: 18662

Hello. Kind of new to radio here and have some questions about
the Euro 3900 AM/FM/SSB/CW Tranceiver
#E00-03000.
1) Does it have a frequency readout?
2) Does it have preset or memory capability?
3) Does it have a sidetone for cw?
4) Does it cover the entire 10 and 11 meter bands?
Any other comments about this radio or any other 10/11 Meter Radios in
the same price
range are welcome. Also, any comments about copper electronics?
Thanks.

The Wilson is a better design.

I experienced improved SWR (transmit) and receive with the Wilson 1000 than with the K-40.

I also like that I can remove the whip/load from the Wilson and store it with out getting grease everywhere. The 1/4 turn on the K-40 was nice but Wilson gives you a cap to protect the base. I've seen similar caps for K-40s but I don't know where to purchase them

Please don't miss understand me, the K-40 is a quality antenna. Put it this way, if you have a K-40 and are happy, there is no need to change.

Everyone has their favorite antenna. The Wilson units are quite popular as they can handle greater power than the K40. Many folks use a full-length quarter wave antenna - which work the best. Myself, I use a Modulator cuz you can't beat the bandwidth and it is less lossy than the Wilson.

well if you dont know how to properly adjust a d104 or stock mic to not overmodulate or pick up "backround"...then YOU sir are the crock! If you were paying attention to the original post you would possibly understand that i was not implying that they were dirty mics,im just saying that for anyone who has any idea what there doing with the mic/radio wouldnt need to spend the cash on one.

>Well, I know this will ruffle a few feathers, but noise canceling mics

Copper sells referbs. they have a special section on their web site for these products. I haven't ever purchased anything from copper so I can't attest to their customer service. Also ask your brother to ask around and see if any of his CB friends have a spare radio that you could borrow or buy. I've let a few people use some of my radios in the past. Some of them ended up buying them, and others decided they needed different features in their radio. Good luck.

If you are looking for a good SSB radio, the Grant is probably the best with the 148 right behind it. I'm not too familiar with the Galaxy 959 or the Midland radio you mentioned. If you do decide to go with the Grant, the pre-ST models can have more done to them to enhance their performance. I have known some Cobra 148s that have out talked some super tuned Galaxy 99s. I had a lot of fun with a Galaxy 73 and the Pluto. Hope you find what you are looking for at a great price.

>alternator, than you are just going to pull down closer to battery volts.
>remember if you are charging a couple of volts above the battery voltage,
>then your alternator will still see the current draw, no matter how many
>batteries you have.

But what I am curious about is, if you simply cannot get more alternator power
than I mentioned and adding as many batteries as I want is possible, is getting
more batteries a good alternative. Since getting more alternator is simply out
of the question.
Is there a limit to how many batteries can help or hurt the system?
Thanks again inadvance

Check out the midland 79-290, it is featured in the latest Pop Com magazine. No need to buy the magazine though, unless you want to read about ancient commercial broadcast radio stations and rebuilding 50 year old Philco transformers. It is a pretty nifty little rig, but it lacks a RF gain control, which is what I dislike the most about it.

snip

Sorry but you wouldn't know how to operate a ham radio if it bit you
in the ass. If you did then you would know that 95% of SSB work
done by amateurs is done with the TX and RX tied. You would also
know that 95% of amateur operators can get within 50 hertz of the
transmission they are listening to. Therefore they would usually never
have the need to use the RIT.

Come back when you have some CB SSB roundtable
experiences. Your opinion will change.

Just to set the record straight, several of the very old 23 channel rigs did have factory sliders in them. Must have been REAL fun trying to tune everyone in while trying to compensate for a poor alignment ON TOP OF crystal drift :) Sean
>

tnom@mucks.net wrote in message ...
A unlocked clarifier accomplishes this. No stock CB can.

841. Here's the bottom line.....

Newsgroup: rec.radio.cb
Date: 2000-01-07 00:00:00 UTC
From: Sean <bigfoot1@megsinet.net>
Message-ID: <mQfd4.1754$9F3.127309@news.corecomm.net>
Source record: 18690

To achieve ANY type of usable ssb communications, the radio needs to be within factory tolerance of the assigned frequency for that specific channel. If the radio is out of alignment and the offset not properly adjusted, it makes ssb communications difficult with OR without a slider. Having all of the radios involved operating properly and within tolerance makes most of this a moot point, slider or no slider.

All things being equal, i prefer the use of a PROPERLY INSTALLED and ALIGNED slider. That puts me squarely on Tnom's side of this argument.

All other things being considered, i get to look at tons of radios that have incorrectly installed / poorly aligned sliders every day. In this instance, i have to side with JJ and Dwight. A factory aligned radio is better than a hack-shack installed slider any day of the week.

Get the radio properly aligned by a competent tech that has their equipment calibrated on a regular basis. Using an in-accurate counter as a reference can create problems that wouldn't have come up if they would have just left the radio alone in the first place. Sean

Message-ID: <8542c1$s82$8@bashir.peak.org>
Source record: 18692

tnom@mucks.net wrote:

: Contrary to what has been said, the origination of the clarifier mod
: was not done to get between channels. When the first radios received
: the clarifier mod they did not move very much at all. They usually
: moved between 1 and 3 kc's. Hardly any good in getting away from the
: noise of the legitimate channel frequency. The clarifier mod was done
: to make the radio more useful. It gave the radio the ability to be
: used in a roundtable.

Not on CB. The original sets were crystal controlled, and AM only.
As such, there was up to several kHz difference in the actual transmit
frequencies. The transmit and receive frequencies were locked to each
other to be 455 kHz apart (because of the I.F. design), and both were
shifted together to improve the received signal strength. The shifting
was generally only necessary with one of the two stations, but sometimes
one might have to shift "up" while the other shifted "down". What t hey
were really doing was both moving closer to the actual center frequency
of the channel.

: There is nothing wrong with a stock clarifier as long as you are
: only going to talk to one other radio. However this stock setup was
: not well thought out by the rule makers when it comes to roundtables.
: The rulemakers only wanted to keep a CB radio channelized. The only
: way to do this was to demand that the manufacturers have a locked
: transmit frequency. It was not their concern that channelization of
: frequency sensitive SSB would make the radios troublesome to
: operate. In other words the manufacturers did not come up with the
: stock clarifier configuration. Their is no technical advantage to this
: type of clarifier setup. It only satisfies the FCC's mandate of
: channelization.

Yep. When people started opening up the frequency coverage of the
clarifiers - the FCC mandated that future radios have receive only
clarify. This was still OK for AM, but caused problems with SSB.

: It is obvious that SSB is very frequency sensitive. It is also well
: known that CB radios are very frequency inaccurate and not very
: stable with temperature swings. This combination creates CB radios
: that transmit on different frequencies. This is hardly a good
: scenario for SSB work when you can't adjust your TX frequency to the
: frequency in use, and that is the flaw in channelization of SSB. We do
: have a solution though. All we have to do is tie the RX with the TX.
: Just adjust your receiver and you automatically adjust your
: transmitter. All this without the use of a frequency meter. How
: simple can it get.

This works if the receive offset is correct on all radios. This is seldom case. I have seen the factory offset anywhere from almost 0 kHz to over 5 kHz. It may be possible, with PLL technology, to set and maintain such a precise offset - I don't know how it is obtained on such sets. I know it was not possible on the old rigs that used crystal synthesizers or even discrete crystals for each channel.

That is fine if all stations transmit on the exact same frequency - but
it does not happen. Maybe if all were locked to WWV then it would be
practical.

THAT'S WHAT I LIKE SHORT AND SWEET ANSWERS MR. PEEKABOO.
HEY NANNAR MY OPINION IS THAT SOME OF THE THINGS SAID ARE INDEED TRUE
BUT, YOU ASKED SOMETHING SPECIFIC TWICE. MY ANSWER TO YOU IS THAT IN
YOUR CASE YOU CAN NOT HAVE TOO MANY BATTERIES. IT WILL HELP YOU SINCE
YOU CANT GET SEVERAL ALTERNATORS. I WOULD ALSO SAY THAT YOU SHOULD KEEP
THE VOLTS ABOUT 1.5 ABOVE THE BATTERIES. SO IN YOUR CASE (I THINK YOU
HAD 8 VOLTS TOGETHER TO MAKE 16) CHARGE AT 17.5 VOLTS!
I SINCERLY HOPE THIS HELPS!

i couldn't agree with you more, and think i just might sell out, they are
just giving the bands away, but one thing, at least they are keeping some
code, that will still keep some of the cbers out, but 75 meters allready
sounds like 11 meters anyway. i got my extra back in 1989, and passed all
the code requirements, and i am blind on top of all that.

The purpose of the RIT is so I can tune the signal to my liking, odd, even harmonics or whatever, and leave the transmit frequency alone so others don't have to retune me. You can set 10 radios side-by-side and have 10 people tune them to a transmitting SSB station so they "sound" on frequency and not everyone will tune it to the exact transmitting frequency, they will tune it to where it sounds best to them which may or may not be exactly on the transmit frequency. You apparently have the "golden ear" in which case you should not be wasteing you time on cb radio but spending thousands on high dollar stereo systems, $150 line cords with gold plated plugs, oxygen-free speaker wires, ect.

Every no-code tech knows the difference between a 9v battery and an oak
tree. The oak tree tastes woody when you touch it on your tongue!

There are places that have used/refurb equpment and I picked up
three radios recently on ebay but you might not want to take a
chance there as you can also get burned. I only paid around $70
for all three radios including the shipping charges and most of that
was for the Johnson Messenger 124-M base radio which I thoroughly
enjoy. I also picked up a Lafayette 740 40 ch. and a RS TRC-24
for $20 and $11 respectively all of which work very well with the only
problem being no power cord or mic for the Lafayette which I easily
corrected.

All the hams on 75m are coded. Since the entry level exam, the nocode tech,
hasn't changed a bit, why would any additional CBers want into ham radio?

Normally i would agree, but with a Cb's out of the box frequency
drift with a temperature change a method of adjustment is
unfortunately needed.

I just bought a Cherokee power mic with a multi tone roger beep model # CMP-4000PRB. It came prewired with a 4 pin Cobra/Uniden connector. I rewired it for my 6 pin Eagle Sidewinder. It works great but when I unkey the mic, the multi tone beep comes through the sidewinders speaker and its REALLY LOUD. I tried an external speaker and the beep came through that one also. Any quick fix to stop the beep from coming through the speaker? Thanks.

Are you using Netscape or IE? That and the version of the browser
can make a big difference. Netscape scrolls the background image
and IE doesn't in the latest version. Also note your OS version.

i feel that way sometimes watching the posts here in usenet. not just
in the ham groups.

anyone can go down to wally world and buy a computer and get on the
internet, but i don't ask them if they have any computer knowlege of
worth before i 'converse' with them.

interesting analogy. most of the people out here in the net are
appliance operators but noone 'blackballs' them.

people will visit websites that were 'generated' by an expensive program
just as much as a website built with notepad. the content is what
counts.

weird.

I would like to buy a nice Stoner Pro-40 Radio. I am also interested in any other Stoner radios or accessories, both CB and HAM equipment.
I am just a big fan of Stoner equipment and have extra money to spend!

Please email me directly at
blueglow@mindspring.com

I want a nice Pro-40 bad$$$.
Thanks,
Mark

Copper sells referbs. they have a special section on their web site for
these
products. I haven't ever purchased anything from copper so I can't attest
to
their customer service. Also ask your brother to ask around and see if any
of
his CB friends have a spare radio that you could borrow or buy. I've let a
few
people use some of my radios in the past. Some of them ended up buying
them,
and others decided they needed different features in their radio. Good
luck.

Dear Phil,

This has already been done although perhaps not with the
particular devices you mentioned. Recently, I read an article
pertaining to the use of cheap mosfets as an amplifier at aprox. 50
mhz. The design was pretty well straightforward and the output was
aprox. 300 watts, which, was the design goal for the devices chosen.
Personally I wouldn't forgo the use of at least an isolation
transformer as a safety precaution. I also would use some type of
regulation even if crude.
Your idea is well worth investigation and work has already begun
in this vain. Good experimenting.
BobC

> Agreed. Nor can I imagine even an "unofficial" FCC reply such as
was quoted.
>
>
I wish I could remember where and when I saw this. It was many
years ago and I want to say I saw it in a response letter in the
QST. The actual text had to do with the recent discovery that NY
city cab drivers were using 10 meter radios and the part about the
marine band was a bit of an adjunct in the same vain as unauthorized
use of a particular band but due to geographical constraints the
FCC's spokesperson, in this article, advanced that he didn't have a
problem with reusing the marine band in lieu of rather expensive two
way gear (at the time there was no FRS) in landlocked areas provided
there was no interference issue to resolve.
At the time of this article, I remember, the FCC was in a big
push to consolidate frequencies and reuse was stuck in their minds.
I want to say it was in the mid to late 70's. I can't be more exact
than that because I viewed the article with only passing interest
and only remembered the fact because an FCC commissioner had even
implied that they would not press the issue if there weren't any
interference problems to deal with.
Popeye provided you with an official ruling that was predicated
on the much earlier statement given in the article I read so many
years ago. Naturally, the FCC had to provide some guidelines for the
reuse of these frequencies otherwise it would have ended up like CB
is now. But the fact remains that it is now legal to obtain a
license to use the Marine Band on land.

> Dwight Stewart
>
Hey Dwight,

It's not me who is putting these people in danger. I'm not the one who's using Marine Radios for inland communications. But you know what? It's been going on for years and I haven't heard of one instance wherein someone had trouble getting help on ch 16 due to land mobile use of the band. The practice started even before there was a vhf marine band. I remember hearing land based use of the old 3-4 mhz stuff. Now there was a definite potential for problems due to the nature of propagation on those frequencies.
Look Dwight, I'm not telling everyone to go out and use it, that's already being done by someone else. But the chances of these guys, in their particular adventure, interfering with anything is extremely small. Anymore, most small pleasure craft on lakes will use a cellphone to call for help or even a cb. because there generally isn't anyone listening to ch.16 in the area. The chances of finding, let alone interfering with, a coast guard cutter on a inland lake in Kansas are rather remote don't you think?

Hi Rapid,
>WHY NOT YOU PHIL
Because I am working on a 1.8Mhz / AM broadcast FET design using 100V devices that only work up to 3Mhz.

I'm looking at ways of earning some money in the near future.

Some of US based amp manufactures seem to have mastered the art of producing CB amp's for very little money.

I'm just throwing in my 2p worth to suggest another road to travel down and make/save even more money.

More power, less dollars.

The ARF FET's as I've stated below will work fine at 30Mhz.

JJ <jj@no.net> wrote in message news:387641FC.37D9@no.net...
.....snipped.....
> God, what an idiot.

I have read each and every post pertaining to this disagreement.
I must take exception to this statement.
Since I am in complete understanding and agreement with Tnom,
Nelson and Sean I perceive that you are calling me an idiot as well.
Trust me when I say I'm not an idiot.
You can also trust me when I say that their way(and mine as
well) works on CB and Ham Radio. It really doesn't matter which
service you go to.
I really do understand where you and Dwight are coming from but
you're unable to grasp what the other guys are trying to tell you.
You're just missing something in their explanations that would turn
the light on for you.
If only two people are talking, your method will work just fine
but if another person shows up who's he gonna tune to? Neither of
your transmitters are on the same frequency. If they were, you
wouldn't need to run your rit. You would have just tuned the other
guy in with your vfo and that would be the end of it.
I gotta' tell ya' I don't wanna hear the argument about everyone
hearing differently on ssb. You're either tuned in or you're not.
There's really no mistaking the sound of an off frequency receiver.
In light of today's CB radios, the chances of the tx and the
rcvr being off freq from each other once the clarifier is unlocked
(wherein the tx and rcvr are tied together) are really small,
provided there wasn't a screw up in the modification.
For the better part of 30 years on the air both on CB and Ham I
have yet to need the rit on voice. If I need to rit on someone it's
because he is receiving and transmitting on separate frequencies. I
let him know he has a problem and if he persists in communicating
with me I might turn the rit on but when I get a few more in the
group, the rit goes off and the split freq. guy can deal with not
being spoken to until he gets his stuff fixed. I'm not being
snobbish(ok maybe a little) I'm just not gonna screw up my entire
time on the air dealing with tuning to each person in the group just
because we're trying to be accommodating to one split freq. station.
I find no enjoyment in that. It just takes entirely too much time to
get 10 or 15 stations tuned in to someone who's rig is split on tx
and rcv.
And Dwight, the reason your marine H.F. rig has a channelized,
fixed transmit and an <optional> rit is because in an emergency you
want your tx freq. to be as close as possible to the Coast Gaurds'

recvr freq. the first time you tx.
You may only have time to transmit once and you cant afford to
be off freq as much as the rit would allow if it worked on tx. Same
goes for a vfo, no time to spin a dial and watch a display to set it
right on freq. You may not be able to hold onto the damn dial long
enough to get the thing on freq enough for anyone to hear your plea
for help. It's a safety thing Dwight.
Also, the rit in your example is usually off. That means your tx
and rcvr freq are locked together and unless there's a problem in
the rig, once the Coast Gaurd tunes to your tx they will
automatically sound correct to you.
I'm not making this stuff up guys. It's worked like this for too
many people for too long to be wrong.

>
> 1. They are tied together on the same freq. Is yours? Are all
the
> other guys?

-----They should be if they have any experience at all on SSB
whether CB or Ham.....

> 2. The Rx and Tx track identically from full left to full right.
I sure
> wouldn't bet that precision components were/are used. Same
>questions apply here.

-----If you had any clue as to how a CB derived it's clarifier
tuning you'd realize that precision components are not really needed
as the same oscillator is used tx and rcv. and unless there's a
tuning voltage change between tx and rcv., this oscillator will
remain on the same exact frequency between the two operations.
----As far as the tuning voltage changing, this will only occur if
the modification wasn't done correctly and not a general fault of
the radios' component quality.
----A note about component quality. You do realize where your Ham
rig is made don't you? Practically the same parts and quality are
used throughout a Ham rig as in a CB. Unless you bought a Mil-Spec
rig your parts in your Ham rig differ only slightly in certain
circuits compared to a CB.
>
> 3. Same with temperature. And voltage.
>
-----Temperature will move the crystal frequency in any radio be it
Ham or CB. There happens to be more xtals in most Ham rigs than
there are in CB's leading to a higher possibility that your Ham rig
will suffer in performance before a CB.
-----Voltage where? Supply voltage isnt likely to bother a CB any
sooner than a Ham rig as there are less regulators to drop out of

regulation in CB than a Ham rig. Both rigs would suffer similarly due to supply regulation in certain circuits.

> Since when is a CB radio stable frequency wise?

-----This goes back to the original question of component quality and temperature.

> >
> > All that being said, it is a fact that you will NEVER get multiple
> > SSB CB transmitters to be on frequency with each other. If this
> > misalignment is the norm, which it is, then how would you align
> > your receiver to two different transmitters on two different

> > transmitters on six different frequencies? The answer is it is
> > impossible when the operators transmitters ares fixed, and very
> > impractical (stupid) with movable transmitters that are not tied to
> > their receiver.

-----Agreed-----
>
> Again, if the tx and rx are not on the same frequency across the range
> of the clarifer pot and across the temperature (as you mentioned) and
> input voltage range, tying together will hurt more than help.

-----Again, not a problem unless someone botched the modification.

> In a perfect world with precision radios and components at a
>controlled temp. and input voltage, your idea works great. Otherwise, >you'll be better off tuning your receive to whoever is talking (provided >there is only one keyed at a time %^)). If that is too much work, you >might consider AM, where these problems aren't really apparent.
>
> JOIHO

-----It doesn't require the perfect world you suggest nor the precision components also suggested as well as the controlled temp or precision input voltage you portend.
-----In the real world unlocking the clarifier is the best way to go, works every time and continues to work for everyone.
-----Drift due to temperature is normal and expected for any rig whether Ham or CB. If it drifts during warm-up, move the clarifier or the vfo slightly to keep up until it stops drifting. If it drifts due to voltage fluctuations, go get it fixed because there's something broken and not normally a problem.
-----Have been using SSB for better than 30 years and have never had to use rit on a ham rig to tune another properly working radio in.

Been on CB as long and never had a radio with a factory stock clarifier that worked worth a shit in a group situation.
-----Anyone thinking otherwise just hasn't been there.
-----I can't believe this thread has had so much time and what's worse is I couldn't keep myself from replying to the damn thing. Go get 'em Tnom, Nelson, and Sean, you got 'em on the ropes now.

Try a ground independent antenna. Cannot remember any names for those which are deigned for CB, but you could look at one designed for the 27 megs marine band. The antenna may be a little short but you can always have a play and lengthen it - just a thought.

> have the need to use the RIT.

Yes, what-ever-your-name-is, that is how it is done 95% of the time in ham radio because the typical ham radio is tuned to much higher degree of accuracy than the typical CB.

For example, I know that the tx/rx on my radio are set to a high level of accuracy (the radio was just checked by Yaesu). Therefore, I know I'm receiving on virtually the same spot as the transmit. However, I still have to use the RIT control occasionally to allow for poor tuning, or drift, in the other radio.

However, I never readjust my transmit while in a conversation. To do so would be improper and downright rude. Once we are in a conversation, nothing I do on my radio should make other operators have to readjust their equipment beyond the initial adjustments - which they will have to do if I start playing around with my transmit frequency.

> Maybe Stewart only has one person to talk to and doesn't have this problem.......

If all the radios are set up properly (as you mentioned), then you
would not have to make constant adjustments to receive each person.
Anyway, how is "unlocking" the transmit going to stop this ("every radio
is a little different" even with a "unlocked" clarifier)?

But with an "unlocked" clarifier, when you adjust your radio to hear
that slightly different radio, you will change your transmit frequency.
When he then readjusts his radio to hear you on the new frequency, he is
changing his transmit frequency (assuming his clarifier is "unlocked").
Now you are not going to hear him properly again, and will have to
readjust your radio again. Then he will have to readjust again, and
then you will have to readjust (and the process goes on forever).

The process is only compounded with multiple operators. Now, possibly
several radios are slightly off. And everybody is readjusting for these
radios. And then these radios are readjusted to those radios. Again,
the process goes on forever.

With the clarifier set like it comes from the factory (the tx locked
and the rx adjusted), all that is required is a simple adjustment when a
radio is slightly off and a quick return to the old setting when talking
with everyone else (the radios that are not off).

OK, here's the deal for the few experimenters out there.

You're all more switched on than me though I am good at research even
though I say it myself.

I've found some current state of the art FET's that work fine at 30Mhz,
cost well under 10 bucks a piece and can be supplied by 300V dc direct
from the ac mains! The ARF446/7 can actually handle 900V.

1Kw output, efficiency >80% @ 30Mhz in class-C.

Linearity restoration by a power modulator.

Just think, no 50Hz mains transformer just like a switching supply.

Who's going to be the first to spend 10 bucks?

Phil / UK

Yes, you're missing something, Nelson. Not all the radios in the world were tuned by you. You tuned all those radios using the exact same method, hince they are all fairly well matched. The rest of the radios in the world are not going to match those radios as well.

Sorry, whatever-your-name-is, but the "unlocked" clarifier clearly identifies the operator as a person who has no idea what he is doing (and was suckered by a someone selling radio mods).

> There is nothing wrong with a stock clarifier as long as you are
> only going to talk to one other radio. However this stock setup was
> not well thought out by the rule makers when it comes to roundtables.

Nonsense, the best setup when it comes to roundtables is to have all of the radios involved properly tuned. The "unlocked" clarifier offers no advantage to a roundtable if the radios are not properly adjusted, and the "unlocked" clarifier does not even offer the you advantage you claim if the radios are properly adjusted.

> The rulemakers only wanted to keep a CB radio channelized. The only
> way to do this was to demand that the manufacturers have a locked
> transmit frequency. It was not their concern that channelization of
> frequency sensitive SSB would make the radios troublesome to
> operate.

Whatever-your-name-is, why was a similar method adopted for nearly all other SSB radios used in the other radio services if the purpose of this system was to channelize CB? Ham radios offer RIT for fine receive adjustment without moving the tx. Marine SSB HF radios offer a clarifier with "locked" tx. Even military SSB radios are adjusted with a clarifier/RIT after the tx is set. None of these radio services are channelized. The system was developed because it works - it simplified the tuning process of the SSB radio.

> It is obvious that SSB is very frequency sensitive. It is also well
> known that CB radios are very frequency inaccurate and not very
> stable with temperature swings. This combination creates CB radios
> that transmit on different frequencies. This is hardly a good
> scenario for SSB work when you can't adjust your TX frequency to the
> frequency in use, and that is the flaw in channelization of SSB.

Darn, you just can't get it, can you? Your system works if you can adjust the transmit separately from the receive (both are adjustable, but using different controls).

However, if you tie the transmit and receive together, there is no way to adjust your receive for another radio that is slightly off frequency

without also adjusting your transmit frequency. And, if that person also has a radio where the transmit and receive are tied together, his frequency is going to change when he readjusts to hear you again. And the process, of you both constantly readjusting for the endlessly changing tx frequency, can go on forever.

One, or both of you, has to eventually stay on a single transmit frequency. And that is the idea behind the locked transmit with adjustable receive - the frequency of both radios stay the same, and each of you adjust the receive to hear the other. The process is simple and effective.

Anyway, this is going on forever. Obviously, nothing I can say is going to convince you. Enjoy your "unlocked" clarifier, whatever-your-name-is.

Yes indeed, its all in the best interest of Ham Radio..sure it is! Look guys, it has nothing to do with the CW requirement. I am 110% in favor of the CW requirement, but the truth is Ham Radio began its demise when the FCC stopped conducting exams. We all know that the VE system is of questionable integrity. You can read about bogus testing sessions every month in QST and other Ham rags. And those are only the ones that got caught! Just think, now any half brain dead idiot can go into a VE session, conducted by his buddies, take a 35 question exam, which he already knows the answers to, and come out an Extra! And this is GOOD for Ham Radio! Somebody explain that to me. Or should I say "rationalize" that to me. I may not be the nicest or smartest Ham in the world, but I'm sure not stupid either. This is definetly The End of Ham Radio. Do you really want to be associated with persons holding Extra tickets who do not know the difference between a 9 volt battery and an oak tree?
I don't.
I guess I must be confused, but I always thought if I EARNED something, it would have value to me and I would respect and take care of it. How much value can you place in an amateur radio license that is easier to get than a parking ticket?
Good bye Ham Radio, it was nice knowing you.

Agreed! But I would INSIST that the written test be comprehensive, and
related to the current technologies. The WRITTEN test is what's
important. Unfortunately, the way the current tests are structured,
makes them little more than a formality.

> many other programming languages. You're far more likely to encounter
> Perl on the Internet than Java.

As far as my comment about the internet being too easy, I was refering to it in the context of a communications medium, It does not take a java whiz, or other programming skills to load some copy of voice chat software into a mickey-soft computer and be able to "reach out and touch someone".

Like ham radio, the computer hobby has people that are users, and there are the "geeks" that know the intricate details of TCP/IP, ATM, and various other networking schemes.

But as far as from a purely communications standpoint, communicating world-wide on the internet is as easy as pointing and clicking. There is virtually NO challenge to it. Ham radio, on the other hand, has many variables that make the pursuit of DX, challenging. And THAT is where the enjoyment comes for the majority of radio ops. If you can't grasp that concept, then you're probably better off on the internet.

> Supreme Court review and rulings.

Zoning laws are superceded by federal law in most cases. Zoning restructions can be challenged and overturned if one has the desire (and money). CC&R's are considered "voluntary" contracts. Still, with the availability of "ham friendly" neighborhood, slowly declining, while the population of hams will be increasing, there may be some legal challenges to CC&R's as well. Stay tuned.

The US is already viewed as "chumps" by a great percentage of foreign counties. As to your assumption that "CBers" will be on HF, that has not be substantiated, and is only a paranoid supposition.

> 3. With the expected increase of operators will the FCC impose a reduce
> power limit so as to maintain appropriate RF field intensities in areas
> of human habitation---for the children.

We already have power, and RF field guidelines which every ham should be aware of. It is up to each individual ham to construct his antenna system to concentrate the major RF power away from habitable space. Hams should, as a rule, use the minimum power necessary in any case.

> 4. Statistically speaking, will the increase of illegal activites that
> will accompany the increased population of amateurs be managable by the
> FCC---if they can't afford (funding, manpower) to manages the mess that
> they created what then.

They can't seem to "manage" what we have now. More hams will only make the job tougher. Ham radio is only a mirror of society itself. When we live in a society that encourages parents to not correct their children, lest it damage their "self esteem", it's no wonder we have so many

people that are quick to ignore rules and regulations.

> 5. What restrictions in advanced design of amateur equipment will be
> imposed now that manufacturers have been stimulated to produce by the
> creation of larger market demand.

That's a strange question. Actually, I would be curious as to what new technologies and innovations can we expect to see now that the market is potentially growing. What new bandwidth saving techniques will be employed? What about digital audio?

I see nothing that would demand a "restriction" on designs. If anything, I see the opposite.

> 6. Will amateur radio disappear into the 'noise' by a future FCC Report

> callsigns to activate strictly regulated (FCC) communicators
> (ex-tranceivers).

That's a sort of Orwellian viewpoint. I think that ham radio should already be experimenting with SS techniques. There are alot of advantages to it. But forcing Hams "under a SS carpet" to hide the dirt, seem a bit farfetched. At least for now.

> 7. Will all amateur HF allocations be eliminated and relocated to
> spectrum translators aboard amateur satellites operating at milimeter

For what reason? That would also incure additional cost. People want cheap. HF is cheap.

>

> burst piggy-backed with amateur transmissions.

Any analog scheme of auto identification can be thwarted by technically competant people. Once you are in a digital domain, it would get tougher. But I would hate to think that a digital encrypted ID scheme would have to be developed to deal with out-of-control hams. At that point I'd be out of the hobby.

>
> 9. Will we tire of 'smokey' reports from one end of the continent to

> eventually outlawed and be replaced by channel selectors.

They already are on most VHF radios. They may call them "VFO's", but they are just 5 Khz resolution PLL synthesizers. As to easing congestion. An HF SSB signal only needs about 2 Khz of bandwidth. Any channel selector that has less resolution than 2 Khz, would increase congestion, since it would force all of these signals into "clumped" channels, instead of allowing them to spread out.

> 11. Will older amateur equipment at some future date be outlawed as the

That's a sure bet, assuming that your Orwellian scenario plays out.

> 12. After April, 2000 will we find that an obtaining and possessing an
> amateur license from some third world country (like Somalia) where
> testing is more rigorous convey greater prestige to it's holder than to
> be licensed in the US.

What country (especially a 3rd world one) has testing standards that are MORE difficult? We, the US, are actually LAGGING many other countries in reducing testing requirements, especially regarding morse code. It's funny that even 3rd world countries recognize that morse is an outdated skill, that is no longer relevant.

What you said is all well and good, and correct. However, from a CB standpoint, what is currently widely available sometimes leaves a little to be desired. Many noise cancelling mikes have "nasal" or "muddy" tone quality. Yes they dampen the noise but they make you sound bad.

In all truthfullness, most Cbers would not have a need for a noise cancelling mike, if they would just resist the temptation to turn up the mike gain. Keeping the gain down and talking close to the mike, in most

cases, will overcome most background noise (Unless you're in a noisy 18 wheeler). Those that truly need a NC mike, should find one that works good, and sounds clear. There is a lot of junk out there.

Why? Because they believe (becasue they've been told by "screwdriver techs", that this is the way to get "loud" audio.

While it is true that without the limiter, your audio will get louder, it is also getting distorted, which makes you harder to understand.

Running with the limiter set to allow the full 100% or a tad more will keep you from distorting, and allow you to be acceptably loud.

The Beer Prayer

Our lager,
Which art in barrels,
Hallowed be thy drink,
Thy will be drunk,
I will be drunk,
At home as I am in the tavern.
Give us this day our foamy head,
And forgive us our spillages,
As we forgive those who spill against us,
And lead us not to incarceration,
But deliver us from hangovers,
For thine is the beer,
The bitter and the lager,
Forever and ever,Barmen

NEED I SAY MORE !!!!!!!!!!!!

Just thought I'd add one thing to this thread, and that is the fact that the
first
several SSB radios that I purchased were Tx and Rx tied and movable Tx
from the factory. They also were 23 ch rigs, and although the dificulties
tuning to a group were evident, we all just agreed after tuning as best we
could to not move our clarifiers once set. Not perfect, but it worked for
us.

I'm not going back that far with the "Contrary" paragraph. What i
should of clarified is that i was talking about the present day radios
clarifier mod. Namely the first PLL radios of the mid seventies.

I have never seen a clarifier mod on a PLL type radio that couldn't,
once aligned, stay aligned, good enough to be used successfully.

>claim if the radios are properly adjusted.

We are talking about CB radios. A CB radio will shift 400hertz at
30 degrees. A cb radio when pushed hard will get warm and shift
the opposite direction.

CB radios in the real world are aligned to different standards.

So in the real world CB radios will be out of alignment to each
other. The unlocked clarifier gives you the ability to self align
your radio no matter where it is, or no matter where anyone else
is. It doesn't matter if you are on a specific frequency or not.
It only matters that you can align to others.

Thanks for the suggestion, Dave. I've already tried paralleling the largest cap in the power supply; that's what I meant when I originally said I "piggy-backed" one cap onto another. Your point about other dying caps is worth checking out, though. I still suspect something along the transmit circuitry is awry since the radio only gets the hum when transmitting, receive works fine...perhaps a cap along the transmit way.
Thanks,
Nolan

>
>Dwight Stewart
>Amateur Radio, Technician
>F.C.C. License: W5NET
>http://www.qsl.net/w5net

I will draw a picture for you.

Horizontal distance represents a frequency difference.

The below is an example of unlocked clarifiers
and three operators.
****
My radio: RX
TX

My #1 contact RX
TX

My #2 contact RX
TX
****
I talk first. To correct this mis alignment two
operators simply tune their receivers in and that's it.
****
Step one
RX
TX

RX
TX

RX
TX
****
Step two:
RX
TX

RX
TX

RX
TX
****
Now because we are all in alignment
#1 or #2 can talk and ther would be no
re-tuning necessary.
****
END

The below is an example of stock clarifiers.
****

Your radio RX
TX

Your #1 contact RX
TX

Your #2 contact RX
TX
****
How do we correct this? How many steps?
Let's see.....If you talk first your #1 contact
will move here.
****
Your radio RX
TX

Your #1 contact RX
TX

Your #2 contact RX
TX
****
Then your # 2 contact will move hear.
****
Your radio RX
TX

Your #1 contact RX
TX

Your #2 contact RX
TX
****
DONE, well that is as long as you are the only on talking.
Gee what happens when it's #1's turn to talk?
Let's see......You move your radio hear.
****
Your RX
TX

Your #1 contact RX
TX

Your #2 contact RX
TX
****
2 moves his radio hear.
****
You RX
TX

Your #1 contact RX
TX

#2 RX
TX
****
Are we done yet? What if #3 keys up? Do we have to
move again? Let's see.......You move hear.
****

You RX
TX

Your #1 contact RX
TX

#2 RX
TX
****
#1 has to move here.
****
You RX
TX

#1 RX
TX

#2 RX
TX
****
****
Now as long as this roundtable is over with
then we are all done adjusting. Oops.......
i forgot. Under most circumstances roundtables
go around and round. I hope you don't get dizzy
with your stock clarifier setup. I'll stick to my
setup.

P.S. I have some cheap dramamine. It's a little
old though. I haven't needed it for about twenty
years. About the same time i tied RX to TX.

I think we are in agreement. In general, the Internet is easier. But not by much. How much harder is it to get a Tech license, buy a HT and talk to someone over a 2 meter repeater? IMO, not much harder than buying a computer, getting and setting up an ISP account, learning to use the email client and sending an email.

Don't fool yourself into thinking amateur radio is that much harder than the Internet for basic comms.

Thank you, did you have a problem with the pictures turning black or
becoming distorted when you scrolled the page? If there is a problem I
will fix it, but it seems to look smother to me, and it seems to scroll
faster than if the background was moving with it.
Thanks for any input.

That is what it is, I built the page with geocities page builder and then did some HTML mods after the fact myself, I have Front page 2000, which I do not have a clue of how to use yet, it was a gift, but like I said I am new to this I remember you telling someone how to "learn to write HTML" in the past, and then you tried to prove you were slick enough to copy and paste my code, as I said the right click disable was put there as an honesty thing, I could give a rats ass if you know how to view the source, hell I stole half of it any way, I did not write none of it. I found all of it on the net.

And if you knew anything, you would know that on ham radio when someone sounds off frequency, they don't retune with the vfo, which will also change their transmit frequency, they use the RIT to clarify the received signal and that leaves their transmit frequency where it is. The other station will do the same and then you don't go chasing each other in order to keep everyone clarified. If on the ham bands one did as you suggest, you would soon be told to go find another qso as everyone would get tired of chasing you up and down the band. Even with all transmitters on the exact same frequency, ssb dosen't sound the same to everyone and someone will retune slightly to clarify the signal to their liking.

Even with all stations transmit on the exact same frequency, the
received signal will not sound the same to everyone and someone will
tune slightly off frequency to make the received signal sound to their
liking.

Date:
Fri, 07 Jan 2000 11:34:26 -0600
From:
Ken <klajr@worldnet.att.net>
To:
cbmw@hotmail.com

I got out an old 8' long fiberglass
deep sea fishing rod and put a nut in the base, wrapped 104" (1/4 wave)
of 12ga
solid copper wire to the very tip (windings about inch and a half
apart) and connected the wire to the nut at the base via a bolt. I
connect the center coax wire to that right? Where do I connect the
shield of the coax? It will be mounted on my roof via aluminum conduit.
Also if I wrapped 208" around it would it work as a 1/2 wave or would
the windings be too close?
Your help will be mucho appreciated!
Thanks,
Ken A.

Hello to the group,
I would like to repair an old Hy-Gain CB antenna for 10 meter use.
Hy-gain Inc. said If I could provide part numbers they could check
their inventory. I am looking for a Pictorial parts break down list for
a Hy-gain Model 500 (Penetrator is the class name). Circa 1971-1977
If any body still has one of these Blue sheets and could make me a
photocopy or a scan it would be much appreciated!
Thanks
Jack

940. Re: Amplified mics

Newsgroup: rec.radio.cb
Date: 2000-01-07 00:00:00 UTC
From: Mike Yetsko <joe@user.com>
Message-ID: <RPpd4.901$ca2.21920@newsread2.prod.itd.earthlink.net>
Source record: 18801

Well, I agree, I think, with your implication that ANY mic can
have it's proper place. But my 'personal' opinion is that the D104
is one of the poorest choices people ever made. It had it's
place at one time. And that was driving tube front ends that
required 2v or more of drive, and for a dirty dusty shack where
it was important to have a mechanically durable device. But
I think we've come a long way from the 50's and 60's when that
mic was appropriate. Once the 70's hit, it seemed that 90%
of the market for the D104 was for idiots that wanted to drive
their radios so hard and harsh they could pretend to other people
they had a Browning Golden Eagle (and don't get me started on
THAT rig! It had it's good points, but they were FAR outweighed
by it's bad!) but they just were loud with lots of distortion.

The question then is not "was" the D104 a good choice, but "is" it
a good choice. And since the question was bundled with the
noise canceling issue, I wouldn't think so. The D104 is so high
drive, and has such a mechanical high impedance that it picks up
EVERYTHING in a room. The only way to quiet that thing down
is to hang curtains and velvet drapes everywhere. And then it
will pick up fans running in the background.

Maybe I was wrong to assume that the original question was tying
the two issues together, and then if you feel the recomendation of
something like a D104 is justified, you can make your case. But
in my 'personal' opinion, I would very rarely ever recomend something
like that for any purpose. What is 'my' favorite mic? Well, it
depends.
Turner made a few nice ones, but they sometimes fell into the 'too
sensitive' trap. If I was seting up a base station, and wanted a good
mic, I think I would use an old ElectoVoice 664 with a pre-amp/equalizer
and a variable compressor. I wouldn't use a regular equalizer. They
come in three variables. There's the parametric, which usually are
movable and definable filters. These are more professional and really
designed to solve specific environmental problems. Then there's
what is commonly called 'graphic equalizers'. But they come in two
varieties. One is the common audiophile version which is essentially
multiple tone controls. The other is the bandpass variety. The first
just boost and cuts specific areas of the audio like a 'boost/cut'
function.
The second is made up of separate bandpass filters that boost and cut
and then sums the outputs to pass the entire band. It sounds like a
very
subtle difference but the second can have a lot of advantages,
especially

when you mean limited voice bandwidth (say 100-2000hz) and not
20-20000. AND I would make sure the operating area had 'soft walls'!

Well, gee, Mr. Cracker, what's up with stupid names? I guess since this message is cross-posted to a CB forum and a general radio forum, that all sorts of handles would abound, stupid or otherwise, so I won't comment, Mr. Cracker.

IMHO, Loek d'Hont is a good respectable fellow that I have done business with in the rec.radio.swap forum before, and he is a good guy, trustworthy, and has the right to complaint if someone is using an image made by him without permission to advertise their equipment.

Have a nice day, Mr. Cracker, you good buddy.

>And if you knew anything, you would know that on ham radio when someone
>sounds off frequency, they don't retune with the vfo, which will also
>change their transmit frequency, they use the RIT to clarify the
>received signal and that leaves their transmit frequency where it is.

Excuse me. If someone sounds off frequency it is only because of two
possible reasons.

1. They are off frequency. With this case you should have them come to
you or you go to them. If he comes to you he has to bring his Tx with
him. If you go to him you should bring your Tx also. If he thinks you
sound off frequency when you bring your Tx to him then one or both
of you have an alignment problem. When your Tx and Rx and his Tx and
Rx are on the same frequency then nobody will sound off frequency.
If they do then you have a hearing problem. See number two.

2. You have the inability to hear the odd harmonics produced when
you are not on the same frequency of the transmission. In this case
the solution is to go back to AM because you will never be able to
tune in anyone on sideband
.
>The other station will do the same and then you don't go chasing each
>other in order to keep everyone clarified. If on the ham bands one did
>as you suggest, you would soon be told to go find another qso as
>everyone would get tired of chasing you up and down the band. Even with
>all transmitters on the exact same frequency, ssb dosen't sound the same
>to everyone and someone will retune slightly to clarify the signal to
>their liking.

Like i said before. If everyone Tx and Rx were on frequency nobody
would sound off frequency. Tying your radios Tx to your radios Rx is
one component in achieving this.Tying your radio to his radio is the
other component in having everyone sound on frequency.

If you are actually on frequency with them, then it is impossible for
them to sound off frequency.

Unless.............. Someone who you are talking to in person
sounds off frequency. If they do then you have a hearing problem and
should be aware that SSB may be frustrating and hazardous to your
health.

The U.S. department of Health and Human services, or HHS
has issued a warning about the use of stock clarifiers. They have
determined that the use of such a device can cause carpal tunnel
syndrome. They further suggest that one might reduce his chance of
getting carpal tunnel syndrome by using a "unlocked" clarifier.

David:

Yes, what you say is quite true. During my regular stays in Argentina
over the years I would often listen to the SW bands. It was quite
stunning to tune through the CB channels and hear regularly spaced peaks
of noise and essentially noiseless spacings resulting from untold
thousands of CB'ers piled together and transmitting simultaneously.
Occassionally, "How 'bout it skip land, Texas trying." or some such
emanation could be heard making it's way out of the mess. Similarly,
the FM studio-transmitter link transmissions from WFLA on 25870 kHz were
heard daily from morning till night with exceedingly strong signals.
Surprizingly, the amateur 10 meter band at the same time was completely
devoid of activity besides the strong beepings of low power amateur CW
propagation beacons from the US---I guess amateur radio mythology
promotes the belief that the sunspot minimiums preclude communications
on 10 meters.

I'm not debating whether you can get Tx perfectly aligned with Rx on
any particular radio. What I am asking is, do you think that someones
Rx is going to always be perfectly aligned with someone elses Rx? If
thier not, then your method of tying the Tx/Rx together will not work
for the very reasons listed in previous messages. Even temperature
differences can cause this in the CB's.

What doesn't work Dwight? The best setup for multiple or
"roundtable" use is when the TX and RX are movable and track together.
Hard to imagine talking to 6 or 7 stations with locked TX, you would
be adjusting your RX every time a new station started trasnsmitting.
Sounds like you have never used a SSB CB radio that was set up
properly. Ask, there are several here that have the skills and
knowledge to help you set yours up correctly.

I am glad we agree.

>What I am asking is, do you think that someones
>Rx is going to always be perfectly aligned with someone elses Rx?

If that "someone elses" TX and Rx are aligned, and if you can hear
odd harmonics of their out of tune SSB transmission, and if you use
these odd harmonics to guide your own clarifier rotation, then the
answer is yes. A capable SSB ear can do this, and capable SSB
users employ the unlocked clarifier to achieve the Rx to Rx alignment
that you are speaking about.

>If thier not, then your method of tying the Tx/Rx together will not work
>for the very reasons listed in previous messages. Even temperature
>differences can cause this in the CB's.

Amateurs with tied TX and RX use their ears to tune to someone all the
time. Why can't we do the same with a CB. It doesn't matter if the CB
or the Amateur radio drifts. Use your ears. If you can't get within 50
hertz with your own ears as a guide then you need to stay away from
SSB.

Even with all transmitters on the exact same frequency, the received
signal will sound differently to different listeners, that is why they
retune on receive, to clarify the signal so it sounds best for them.
Not everyone hears an SSB signal the same.

>
> 2. You have the inability to hear the odd harmonics produced when

And like I said before, even with all transmitters on the same frequency, the received signal will not sound the same to everyone. Response of the audio section of the receiver and speaker can make a difference in how the received signal sounds. Some will want to retune to make it sound better. Sheeeesh what a moron.

You apparently suffer from a lack of self-esteem.

If YOU are a courteous operator with wide, deep technical knowledge,
then YOU are a valuable radio amateur. One could match my description and
hold a General license or below, or even no amateur license at all if you
worked, say, in military or commercial communications.

But it seems that this isn't enough for you. You crave that piece of paper
which says "Advanced" or "Extra" on it, not because of what YOU are and
what YOU have accomplished, but rather because of the mark the LICENSE
PUTS ON YOU, because of the "specialness" it confers on you, because of
the "distinction" which you believe it will afford you.

If that's all you want, just have a fancy, official-looking embossed piece
of paper framed and put on the wall next to your $3000 general-coverage
receiver. Only a tiny handful of people will know the difference.....

Name calling????????? If you can't hear the odd harmonics produced by
a persons off frequency voice, then you need to stay away from SSB.

Your audio response and/or your speakers response has no play in
creating or eliminating odd harmonic sounds. These odd harmonic sounds
are totally tied to a off frequency tuning scenario. If you "want to
retune to make it sound better" then you should use a audio response
network to do so. Taking the clarifier out of tune to adjust for a
tonal sound quality is a mistake. The clarifier is used only to
eliminate odd harmonic sounds.

The page looked fine to me. I had no problem viewing the pix.

It is true that if your background is NOT static, the page does in fact scroll smoother.

If you like the look of a static background, but DON'T want the jittery scrolling action, there is a way to create a DHTML "watermark" which will give you that ability.

If you're interested in the source code for that let me know and I'll post it publicly, though I'm sure it's already available in code repositories across the web.

980. Re: Old Hy-Gain Antenna

Newsgroup: rec.radio.cb
Date: 2000-01-07 00:00:00 UTC
From: Jay <jay123a@qnet.com>
Message-ID: <387638B2.92AD3220@qnet.com>
Source record: 18841

Hello Jack: The old Hy-Gain Penetrator 500, 5/8 wavelength ground plane, great antenna. I have been doing a little testing with them. And have had new and heavier duty replacement parts made in a machine shop.

The Penetrator 500 will go to 10 meters in New York heart beat. There where 3 basic P/N's manufactured. But I have either really new or old Penetrator parts, that aren't shown on the three different P/N's that I have copies for. All modern (Good ones) Penetrator 500 5/8 CB Base Antennas have:
1- 2 holes drilled in the 7/8 OD 1st ground radial tubing, 2.25 inches apart, center to center.
2- External Beta match wires.
3- 4 each top-hat wires.

Here are the 3 modern Penetrator 500 measurements.

P/N 800290 Believed to be the first version, made to work on the center of the 23 channel CB band which is 27.11MHZ.
Vertical element lengths:
1 1/4" = 77 inches
1 1/8" = 55 inches, 52 1/8 inches exposed. Swedged reduced to 7/8.
7/8" = 48 inches, 45 1/2 inches exposed. Swedged reduced to 5/8.
5/8" = 48 inches, 45 1/2 inches exposed. Swedged reduced to 7/16.
7/16" = 52 1/8 inches, 50 inches exposed
Total length from the top of the 1 1/4 element = 193 1/8"

P/N 801090 Second version 23 channel, allowed the manufacture to make 2 Penetrator 500 antennas from one length of 1 1/4" tubing, at 144" long.
1 1/4" = 71 inches
1 1/8" = 55 inches, 52 1/8 inches exposed. Swedged reduced to 7/8
7/8" = 55 inches, 52 1/2 inches exposed. Swedged reduced to 5/8
5/8" = 47 inches, 44 1/2 inches exposed, Swedged reduced to 7/16
7/16" = 52 1/8 inches, 50 inches exposed
Total length from the top of the 1 1/4 element = 199 1/8"

P/N Latest and greatest. Made 3 inches shorter to have a good SWR on the upper, new 40 channels.
1 1/4" = 71 inches
1 1/8" = 55 inches, 52 1/8 inches exposed, Swedged reduced to 7/8
7/8" = 52 inches, 49 3/8 inches exposed, Swedged reduced to 5/8
5/8" = 47 inches, 44 1/2 inches exposed, Swedged reduced to 7/16
7/16" = 52 1/8 inches, 50 inches exposed
Total length from the top of the 1 1/4 element = 196"

All modern models have the same ground radial length, they are:
7/8" = 24 inches, Swedged reduced to 5/8

5/8" = 33 1/2 inches, 31 inches exposed, Swedged reduced to 7/16
7/16" = 52 inches, 50 inches exposed.
Total length from tip to tip is 105 inches

To get the Penetrator 500 on 10 meters, you can probably just remove the 4 each top-hat wires (10 inches long), and if need be, shorten the antennas length a few inches at a time, to get the lowest SWR in the 10 meter band.

The place to adjust the antennas length, making it shorter, is where the 1 1/8 tubing fits into the 1 1/4" vertical element.

The aluminum tubing is all .058 inch wall thickness, except for the 7/16 pieces, there are .060 or .065 inches wall thickness.

The all the aluminum tubing pieces can simply be repaired or replaced with
other aluminum tubing with .058 wall thickness. Looking the ARRL Antenna Handbook, in the Materials chapter, they show how aluminum tubing .058 inch wall thickness will fit over and into each, in 1/8 inch increment sizes. You will half to cross cut slots into the ends of the tubing to allow the hose clamps to tighten onto the next smaller size.

Shoot me your address and I'll send you photo copies of the Penetrator 500, assembly instructions, and parts list.

Hope this helps ya out!

Jay in the Mojave

ARRL Headquarters
Newington, CT
Press Release
National Amateur Radio Association Changes Name!
Newington, CT.
Dec. 30, 1999

In cooperation with Trio-Kenwood Corporation, the American Radio Relay League has officially announced its first and only name change since the inception of the organization in 1914. Effective immediately, the ARRL will henceforth be known as:

"The American Radio Recreation League."

In addition to this major name change, the organization will also be officially referred to as "the National Association of Citizen's Band Operators." During a recent press conference, ARRL officials stated "recent changes in FCC regulations have opened whole new horizons to the amateur radio operators of the future." Our goal is a world of experimenters using Amateur Radio frequencies for interactive 'chat rooms,' on-line video production, and 'CB-style' Chatter!" During recent FCC restructuring hearings, the American Radio Recreation League pushed for expansion of the "SSB," or "radiotelephone" portions of the RF spectrum. ARRL officials felt this would not only promote amateur radio to the youth of tomorrow, but would also encourage the purchase
of SSB equipment and high power linear amplifiers manufactured by their corporate partner, Trio-Kenwood Corporation. "We felt that Amateur Radio should be more informal in nature, like the fun old-days of CB radio", stated one ARRL official. Because recent restructuring has eliminated most requirements for meaningful radiotelegraph skills, observers have indicated that many more operators will be attracted to radiotelephone conversations on the Amateur Radio bands. "This will insure greater political leverage in the face of upcoming fights to maintain our valuable radio spectrum," said Gordon East, a well-known publisher of Amateur Radio training materials. "We
feel any loss in sales of CW educational materials will be offset by significant increases in sales of our new '10-Code' guides and similar publications" he further stated. However, not all radio amateurs agree. Some have argued that re-allocation of existing spectrum to phone operation
would inhibit the development of high-tech experimental modes such as data transmission. However, Recreation League officials disagree. "More SSB is the answer," stated Ron Kenwood of the ARRL staff, "we believe the future of Amateur Radio is in the sales of more radios!" The new ARRL Name and logo, a circle containing the letters "CB," will be unveiled at this year's "Dayton

CB Convention," formerly known as the "Dayton Hamvention."

Some ARRL members have vowed to keep up the fight for high operating standards, however, few hold out hope for the future of the hobby. "We're going to try to maintain an interest in public service and high technical and operating standards, including radiotelegraphy," stated Walter Phillips, a member of a public service network specializing in radiotelegraph operation. "However, we are feeling rather pessimistic these days" he further stated. FCC officials were unavailable for comment; however, inside sources have suggested that Kenwood Corporation, a Japanese Company, had major influence on this US Government process.

In additional news just released, Kenwood has announced that all equipment they manufacture from this point on will no longer have CW capabilities and for those CB'ers that have purchased equipment - either at hamfest flea markets, truck stops or ham radio dealers - can send it in and have CW capabilities removed for a nominal sum and returned within 5 working days. Additionally, all microphones provided with their equipment will be "powered" mikes and have re-verb chambers built in for adding to the fun and frolic that is expected to proliferate on the amateur bands.
"It's a sad day for Amateur Radio" was a comment heard from several operators as the restructuring decision was announced. Members of the "CB Dealers Association," on the other hand were ecstatic, celebrating in a drunken orgy that lasted into the early morning hours at a local Washington hotel. "An interesting juxtaposition," one FCC official commented.

At present I believe we can perceive this as a joke. BUT, you know what happens to jokes! Sometimes they get elected to congress!!! This too may come to pass if we're not careful!

And an even larger percentage of folks could NOT care less about you
or things you feel are important in your life, yet those things are
still important to you, right? One thing we are assured of is that the
folks participating in this thread do care, so for calculating
our base for your percentage, we should not use "all human beings."

>> Don't worry about your pathetic little
>> world being overloaded with newbies, they aren't interested.

Again, the base for this percentage you want to use isn't "all human
beings," but rather licensed amateur radio operators.

>Exactly, there was a time when being able to communicate all over the
>world using your own shortwave equipment was a fascinating thing, today
>anyone can pull a cell phone out of their pocket and call almost anyone
>anywhere in the world.

If you don't mind using millions of miles of telephone company cables
and billions of dollars of corporate- and government-owned computers.

The attraction to worldwide communications via amateur radio is that
one has very little dependence upon those things cellphone and inter-
net users depend on.

>Most people don't ever know what ham radio is (or
>think it is cb radio) and could not care less.

That's the way it's always been. Most people don't care about coin-
and stamp-collecting, but that fact doesn't diminish those hobbies.

Jeff

Really? Try pulling up alongside someone with a cell phone and shout out your window, "hey I'm talking to Australia on my mobile ham rig, ain't that impressive?" They will really be impressed as they dial a few numbers and talk to someone in Hong Kong with no fading or static. They don't care how it's done, your ham set isn't going to impress them one bit.

Sorry Cecil it has gotten a fraction easier they only have to
pass one test not two, and it is tohoped that the one test will
include VHF stuff basicly since that is waht the license will cover,
rather the odd anomaly of existing exams.

OTH I do agre not enough basic change exist to expect that
somebody currently operating radios (CB or Pirate Ham or whatever)
without bothering to obtain one of our license is going to sudenly
decide to get one

The following was sent to me in a e-mail from AES....

New. And the Band is hot!
Ranger RCI-2950DX 12/10M Transceiver
An old favorite now updated with an improved receiver, double FET
balanced mixer, surface mount components and improved display lighting.
Operate local communications as well as frequent worldwide DX, base or
mobile. Participate in club events, emergency communications and more!
The unit covers 24.800-24.9900 and 28.0-29.6999MHz with an RF output of
25W on SSB and 10W on CW/AM/FM. The RCI-2950DX also features auto SWR
monitor, receiver clarifier, noise blanker/ANL and programmable repeater
offset. The unit has a large frequency display with dimmer and an active
frequency scanner with 10 programmable frequencies. A frequency selector
lockout and PA feature are also included. $249.95

:> others don't have to retune me.
:
: Tell me, just what method you that you employ to get all transmitters
: to transmit on the same frequency?

Locally, we have always used concensus. Most of the stations have their receive offset properly set - so it is easy to get them all transmitting on the same frequency - or at least close enough that it doesn't bother anyone.

If another station joins us and is off - someone will tell them so, and they will have to shift their transmit frequency until they sound good to us. If they do not have RIT, then they just have to live with the rest of us not sounding "right" to them.

Sure. But for station "A", that retuning will be identical for ALL
transmitters that are on the exact frequency. Now "B" may use the
RIT to make everyone sound a bit different - but again that offset
will be identical for all of the stations.

1023. Re: R Beep coming through speaker

Newsgroup: rec.radio.cb
Date: 2000-01-08 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <3876f1b7.326364253@news.iserv.net>
Source record: 18872

Greetings!

Don't use the microphone with the beep on.

It's a problem with RX/TX switching.

The TX enable line, along with the RX line for switching between both, share the same ground reference.

When the TX is enabled, the ground return should only occur for the TX side, in doing so, on a Cheapie AM CB radio - the speaker is disconnected, on SSB-type radios, the electronic switch mutes the speaker thru a transistor that shunts the audio before it gets to the audio amp chip.

When your radio isn't set up for it, the radio thinks the RX side and TX side are both on, the speaker is also connected, and you hear the beep once the wiper of the DPDT switch closes the speaker return wire and thats why that "LOUD" beep is heard.

On SSB - electronically muted switching radios, the beep needs to be hardwired in. The reason for that is due to the muting of the audio amp chip and how it's controlled. The external mic connector can't do the proper wiring and switching to handle what you want - and the radio does what it thinks it should do, and you, and other stations listening, hear the beep.

While Dancing with the Mouse on Fri, 7 Jan 2000 19:50:34 -0500 (EST), the Modem interrupted with an MNI from "thumper485@webtv.net (Chris)", and the MotherBoard buffered this to Video RAM:

Maybe the inability of the locked crowd to understand the value of
a unlocked clarifier is derived from a belief that a fixed transmit
won't drift? The truth is a fixed clarifier drifts as much as an open
one.

> Your idea is well worth investigation and work has already begun
>in this vain. Good experimenting.
Great.

I heed your advice re iso transformer. You know how things are in the,
here today, gone tomorrow, world of CB amp's though.

Many end users have no idea what goes into making a good or bad amp.
They just want to key up and be heard.

Are you out NV way by your e-mail address?

I'd very much like to see some of this work next time I fly out.

Just received my invite package from Sonny in Detroit for the Memorial
Day weekend so will try to fly out again for this bash.

Are there any other 'large turnout' events happening before then?
Preferably where it's sunny?

Sorry, Bob, I didn't mean for that sentence to sound like it applied to you - it was a general statement directed at anybody considering the use of a marine radio for anything other than what it was designed for.

Anyway, we're not just talking about channel 16 here (the marine distress channel). Marine radio is used for all types of important marine radio traffic. Various channels are set aside for vessel-to-vessel communications, traffic-control, port & dock operations, enviromental information, locks & bridges, commercial radio traffic, and marine-telephone. Interference on any one of these channels could put people at risk.

> in Kansas are rather remote don't
> you think?

Well, it is obviously true that he is not likely to run into a cutter on an inland lake, Bob. But what about the chance of interfering with the local marine search & rescue squad looking for a missing child on a lake or rushing to help a boater whose vessel is on fire? Those are real possibilities on almost any lake (even in Kansas).

Look, I'll admit that the risk of interference is small. But why take the chance of putting anybody at risk (even a small risk), when it is an absolutely illegal thing to do, the possible consequences are high, and there are so many other alternatives to choose from (CB, Ham, FRS, etc.)?

Anyway, I've said about all I can say on this matter. I trust most people will use their best common sense when it comes to marine radio. Take care and please boat safely everybody.

Its your choice, I do that as a respect thing, if the photos amaze you, take all you want, it said e-mail me for any photos, I have a huge file made to send to people that were interested, it contains a lot more photos than are on the page, even some of the ones prozac asked about a while back that I chose not to put on the site, I have a shitload of amp pics, it was just a respect thing and what I thought was a cool HTML tweak.

They would also claim they don't censor anybody driving the AOL car,
when in fact they routinely do. AOL sets up or approves all forum
topics and then prohibits any discussion outside that forum topic (in
effect, censoring any discussion they don't want you to have).

The TX and RX are locked to the same frequency in the clarifyer circuit. It you don't have a good tech to unlock the clarifyer that's when you open a can of worms. I ran a Cobra 2000 GTL fully converted. It worked fine until I talked with our Group Friday nights who had older rigs and was done with out realigned. As one other person on here is trying to point out a CB with an unlocked clarifyer does not come close with a radio with a VFO.

A VFO rado is totally built from from to back differently. As far as talking on two frequencies that is why some hame radios have dual VFO's.

Having said that, There were so little real bad aligned radios, I just never bothered to talk... mostly on DX.

73's,
John

Once upon a time there lived a little troll named bob, bob wasn't like the other trolls in that he had challanged the institution known as the "Good Iittle Troll Authority" (GLTA for short) and won. This, however, was not enough for bob, through his beady little troll eyes he saw that the GLTA was unwittingly inhibiting the advancement of troll culture by forcing it's youth into slave labor sewing shoes 2 sizes to small for even the tiniest troll foot. Bob Thought that the troll youth should be free to sew shoes of any size they chose or even not sew shoes at all but, alas, the GLTA wasn't to happy with bob's idea's on freedom of youth shoe making so they told bob to wear the blue hat. Bob moped over to the village hat rack was about to put on the blue hat when he realized that he didn't have to wear the blue hat just because someone from the GLTA said to so he walked back up to the GLTA "official" and said "I'm not going to wear the blue hat" "but I said to, you have to!" retorted the supposed authoritarian troll "you can't make me" calmly replied bob "oh yeah!" exclaimed the the GLTA official "you bet" said bob, "well damn..." said the redfaced GLTA official "let me go get my supperior" "ok" replied bob. Shortly a slightly over weight troll appeared at the door of the sacred troll pastry shop where the GLTA was headquartered, "what seems to be the problem?" he asked in his jolly fat troll voice as he munched on a sacred troll pastry "this fellow refuses to wear the blue hat" replied the GLTA official "did you tell him he had to?" asked the fat troll "yeah, but he still won't do it" said the GLTA official in an upset troll tone "well...let's see what the sacred book of the troll code says about this" with that he produced a silver whistle from one of his troll pockets and blew a little tune, soon 4 trolls came into sight carrying the sacred book of the troll code opened it in front of the fat troll. The fat troll flipped through the pages and stopped on a page with a picture of the blue hat "It says here" bellowed the fat troll "that he who refuses to wear the blue hat shall have his foot stepped on by a troll with a big fat ass" the crowd of trolls that had gathered around the scene chuckled "get me a troll with a big fat ass!" exclaimed the fat troll. The crowd tried to hold back their laughter until a little girl troll said "why you've got a big fat ass, why can't you step on his toe?" "cut out your troll foolery or I'll have you making shoes 5 sizes too small! I have nothing of the sort!" exclaimed the fat troll "why I think you've got the fattest troll ass in the whole village" added another troll "shut your mouth or I'll have you wearing the big yellow hat with the fluffy pink feather thing!" exclaimed the angry fat troll "I actually kind of like the big yellow hat with the fluffy pink feather thing, can I try it on?" asked the smart mouthed troll. Suddenly the little girl troll pulled a gun from her little troll bag and shot the fat troll through the head "why you little....." uttered the fat troll as he fell over on the ground and died.
well....I got bored.....

Thats what my dad says bill....he has his general license and has been doing it since the 60's. I think no-code has ruined amateur"ham" radio. I compare it to cb now where anyone can do it. jmo

Thanks for proving my point nailbiter err sharpshooter. case closed

In the meantime, the fact you'd think I'd go to all that trouble. for lil
ol you?? You must think highly of yourself. But as stated before, your
little sharpshooter persona goes back to NOvember on the CB NG's, where
quite frankly you deserve to be, if they hadn't run you off on a rail.
Thanks for the kill filter (I doubt it though).

I am sure sharpshooter the wacko jacko won;t even show up any more now
that we know its JOHN, KC2FNG scanner monitor extraordinary

Believe me shit happens, I've seen many a effort canceled due to Mr.
Muffery's law, when just the night before things checked out great. Good
deal that you keep your equipment in good working order. But I must
admit I keep a spare mic in the car.

Yes I can recognize a joke. But sometimes written text loses it human traits of being there (in front of the jury) and seeing the person talk. One of the boys at the local coffee shop when speaking, turns his ball cap at a 22.7 degree off center angle, and a entertaining look comes over his face and he starts to explain his (lies) story. "Smiling Wink" been on this newsgroup since 1995 and never heard of it.

This discussion and all the others that you post to with your snotty and unfriendly ways, and bold "Amateur Radio, Technician" signature say a lot to this group about amateur radio. Looking at your posting history, snotty and unfriendly is very easily interrupted. And its a shame that a lot of people here on this newsgroup think that all Hams are a bucket of snott. When they are not.

Hello Dwight: Yes censorship and AOL go hand in hand. I've seen posts removed the next day after being posted, on the AOL boards. The posting content contained something about how AOL sucks.

I would think that the AOL car would cost like a Mercedes, and drive like a 64 Buick. And to get out of it, is real tricky, because there ain't no door handles.

Or maybe even better ..... Putting in a $20 dollar bill in a gas pump and only getting 3 dollars of gas, but the price indicator on the gas pump says $20. What a sinking feeling.

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the road ah ways from the fillin station.

But isn't requiring operators learn code *equivalent* to
requiring potential voters learn to play a musical instrument
before becoming eligible to vote?

*i couldn't agree with you more, and think i just might sell out, they are
*just giving the bands away, but one thing, at least they are keeping some
*code, that will still keep some of the cbers out, but 75 meters allready
*sounds like 11 meters anyway. i got my extra back in 1989, and passed all
*the code requirements, and i am blind on top of all that.
****

The code provision had to remain due to treaty. The ITU requires that all amatuer licensees operating under 30MHz must have proficiency in code. The ITU does not mention at what level is considered proficient. I got my Tech class license in 1977 and the 80 M band was not any better than it is now. I also have a BSEE degree and feel that element 4A and 4B are easier than many of the EE classes that I took. I just see no need for element 1B, and 1C. To me it does not mean I will operate on 3890 KHz any better or worse. Besides to operate on 80M phone you must have to operate with a general class license or higher. Until 4/15/2000 that still requires a minimum of 13WPM code. If I were to try and draw some conclusion from you post, it may seem that as one becomes more proficient in code, one becomes a better operator. BUt at this time I will try and refrain from such endeavor.

Cecil:

Agreed. The same kind of comments were raised in 94 and in 87. The CBer are comming!. I did not know they were even breathing hard!.

No the sky is not going to fall in. There is not going to be the mass migration from the CB band to the HAM band. The only way that will happen is for the code requirement to drop totally and I do not see that happening for 10 to 20 years from now. The matter has tried to get on the docket for the ITU annual meetings the last three years. It has been shelved evrytime. The last I heard the matter is dead until 2001. So for many amatuers th at think the sky is falling in, look up it is not. What will happen is there will be large number of upgrades withing the mamatuer ranks inthe US. Extra class will replace the general class as the most issued. Not code tech and general class will remain the least issued. The influx of new licensees will most likely not exceed 20K per year. The exit rate due to lack of interest and death will still most likely come close to or exceed that number. Still after 5 to 10years the amatuer population will still be smaller than it is today.

John Amero nights who had older rigs and
>As one other person on here is
>trying to point out a CB with an unlocked clarifyer does not
>come close with a radio with a VFO.

FINALLY... someone who understands! Forget the stupid mods that cost you $$$CASH$$$ (and don't work well anyways).... spend the cash on a rig with a VFO!! Get away from the "channelized" rigs and your on your way to more enjoyment of your radio, more DX and, and more fun!

>used throughout a Ham rig as in a CB. Unless you bought a Mil-Spec
>rig your parts in your Ham rig differ only slightly in certain
>circuits compared to a CB.

What are you smoking??? Can I get some??... Only the bottom dollar Ham rigs are single conversion recievers (almost every CB is)... most Ham rigs are double and triple conversion.... there's no comparison when it comes to a combination of Selectivity and Sensitivity between the two different types of radios (please note the word "combination"...) Components?... if you mean transistors, resistors, and capacitors, etc.... Sure! They're all the same! But it's circuit design that matters far more!

>-----Temperature will move the crystal frequency in any radio be it
>Ham or CB. There happens to be more xtals in most Ham rigs than
>there are in CB's leading to a higher possibility that your Ham rig
>will suffer in performance before a CB.

Hmmmm... Has it ever occurred to you that circuit design might have anything to do with stability? It costs more to build the more complex circuit required for a stable oscillator...

>Been on CB as long and never had a radio with a factory stock
>clarifier that worked worth a shit in a group situation.
>-----Anyone thinking otherwise just hasn't been there.

I'd agree.... tell the fella who comes in and wants his "channelized" radio modded to save his money and get a rig with a VFO and RIT... I can't believe the $ I've seen people spend trying to make their 40 channel radio into a SSB performer... by the time the "Techie" gets done with 'em they've blown what would've bought a nice rig!

Y2K! gotta horde water Y2K! the world is ending Y2K! raise rabbits for food Y2K! .....whoops, wrong topic, same outcome.

We will wake up on April 16, 2000 and ham radio will be the same.

We will wake up on April 16, 2001 and ham radio will be pretty much unchanged.

Get over it! Life and Ham radio will go on.

Its changes will have more to do with the advancement of technology than CW requirments.

Hey, I got one for ya! The latest "politics" of ham radio, and the hate and disregard I have watched and heard sends me running. I am not relinquishing my license, I enjoy *some* of ham radio a lot. But, I have my eye on nice shiney new Cobra CB radio that I am going to get...and I am going to run just as fast as I can back onto a band where I never experienced all this amateur radio brotherhood stuff (you know, the insults, degradations, threats, etc.). I have been a licensed amateur for about the last five years. I have been on and off CB all my life. Just before getting my license I was introduced to SSB operations on CB. Lots nicer, lots nicer....

So, that's some irony, eh? Maybe you doomslayers are wrong. Maybe lots of folks will get back to the friendlier band...CB

If you add batteries to make up for a deficient charging system all you will do is burn up alternators.

The juice has to come from somewhere, and it comes from the alternators... If you have not enough coming out of them to keep the batteries charged, adding mo batteries ain't a gonna help.

Now, if you operate SSB, a couple batteries on a high output stock alternator will work.

I have never seen a vehicle that couldn't have the alternator upgraded, though.

The Uniden Pro 510XL is about the best small radio on the market. It will easily do 20 Peak watts and will talk with the best of them on AM.

If SSB is what you want, get a Uniden PC-122.

Bill Good has had one for over 6-months.

Who is Bill Good? He was contracted by Mr. Ping to work out
the problems with the original RCI-2900 (which became the much
upgraded RCI-2950). He was contracted again to work on the
DX models.

The problem with RCI is that they do NOT listen. All they want
to do is build a CB and not a quality transiever.

As far as being modified, yes they can! The new surface mount
components will make 99% of the techs out here worthless though.
Surface mount components take extra care when installing and
removing.

Bill has a mod that fixes MOST of the problems with any of the
RCI radios. You won't find a better tech! Period!

I've said this before here too...Bill Good came up with over
20 mods for the original 2950 and submitted them to RCI for
adaptation. RCI refused. They want the minimum they can put
into a radio to sell it. Bill's current mods fixes MOST of
these problems.

For those who know Bill will agree with me.

In my book, $15 is very close to $11. Especially after finding or buying a carton, packing and driving somewhere to ship it. Never mind filling out forms.

Is your CB handle gonna be "Boob"? It would fit. Someone who chooses
"tit" for a Vanity call sign shouldn't complain about garbage mouth hams.
Garbage mouth or garbage mouth call? No difference. Believe it or not,
ham radio was once a family rated hobby...

```
I have a MINT condition Galaxy Saturn for sale.... its the 6 band version, it
goes down to 25 megs and up to 28.900 megs, its an extremely LOUD radio and has
extra filtration for virtually eliminating ANY and ALL bleed over, I originally
paid 545.00 dollars for it, and am willing to take 375.00 dollars for it, it
comes with a stock microphone, OR for an extra 150,00 dollars you can have a
Demco electronics microphone modulator with a silver eagle amplified mic, this
would make this a very unique and insainely loud set up, i guarantee NO-ONE
will out talk this set up, unless their running a kilowatt or two. anyone
interested please contact me directly at my e-mail address, jj475171@aol.com
and thanks for reading my post, Happy New Year to all.............. Frank in

As you apply a load to a charging system that is not capable of keeping up with the demand, it falls back on the batteries and pulls the batteries down in volts, if you pull your batteries down half a volt it would surprise most people of the amount of current this would put on the charging system, I mean pull down as in weaken the charge that was on the batteries when you first keyed up.

Jerks are all over, I must apoligize about the elitist attitudes found
in ham, one of the reasons most people arn't interested.

I am not
> relinquishing my license, I enjoy *some* of ham radio a lot.

Amateur Radio has a lot going for it, the changes will make it easy for
some people to get licenses, fer sure but, the ones seeking out ham
radio in the 21st Century will be for different reasons than most
earlier hams. A trucker friend of mine has expressed interest in
getting an upgrade and his wife licensed so they could communicate while
he is on the road, a guy working on the boats in the Gulf of Mexico has
the same idea and I see a future for improved technologies.

But, I
> have my eye on nice shiney new Cobra CB radio that I am going to
> get...and I am going to run just as fast as I can back onto a band where
> I never experienced all this amateur radio brotherhood stuff (you know,
> the insults, degradations, threats, etc.).

I have seen the same behaviour on CB as well as ham so I just say adios
and move on to a better class of people.

I have been a licensed
> amateur for about the last five years. I have been on and off CB all my
> life. Just before getting my license I was introduced to SSB operations
> on CB. Lots nicer, lots nicer....

Kim, most SSB is copied off ham techniques.

>
> So, that's some irony, eh? Maybe you doomslayers are wrong. Maybe lots
> of folks will get back to the friendlier band...CB

Actually a have quite a few of each on order I was just looking for some for the time being.

But I think it is great that you have so many pieces.

That's what Kim wanted it to mean. She said so here. Those people who use the word on their t-shirts (in public) also leave little doubt what they mean.

>why don't we...change the name of...The Grand Teton

In a polite society there are verbal standards. "Tit" is recognized as vulgar slang. It is not unusual in the locker room, but is (was) usually off limits in a mixed family setting such as ham radio. Breast and Teton are legitimate words when used in the correct setting. It's not the body part that's vulgar, it's how, and in what context, the word for it is used...

>Lets be Gentlemen and not insulting adolescents.

Gentlemen would not use the word in public. Adolescents probably would. Even many elementary school children know the word, but they certainly would not get away with using it in a classroom. Why is ham radio any different...

There is a use for it as long as it uses less bandwidth than the voice
modes and besides,it's fun.The Navy still uses CW in some situations but
weather they do or not I don't see what that has to do with us using it
in our hobby.
The Army doesn't use jeeps anymore but a lot of people wouldn't drive
anything else.

ENHANCED ENFORCEMENT ENTERS A NEW YEAR

As the new year gets under way, FCC Special Counsel for Amateur Radio Enforcement Riley Hollingsworth hinted he might have to break bad on hard-core offenders this year. He explained that poor or lax FCC enforcement in the past led him to be more forgiving of rulebreakers during his first full calendar year in the enforcement chair. Now, those who persist in operating outside of the stated basis and purpose of Amateur Radio "are beginning to try our patience," he said. "I can't say we're going to be as compassionate this year."

Hollingsworth said he expected to continue his focus on incursions into the 10-meter band by unlicensed operators, especially as propagation gets better, and on equipment certification issues. "We're very concerned about the illegal equipment we see for sale at hamfests," he explained.

Overall, however, malicious interference remains "the basic problem," as he put it. "We're going to use the High-Frequency Direction Finding Center at Laurel [Maryland] more this year" to track down rulebreakers, he said. In addition, Hollingsworth now has enhanced monitoring tools at his Gettysburg office, allowing him access to the HFDF Center's 14 antenna fields plus VHF-UHF "pods" that can be moved around as necessary. "We have dial-in capabilities to all of our antenna fields and to the pods, so we can cover HF, UHF, and VHF anywhere in the country, right here from the Gettysburg office," he explained.

"It's a force multiplier, so to speak," Hollingsworth said of the new capabilities.

<GIGGLE> Aaron: You know what? Just as the rules now will allow me to upgrade to General or Extra with the existing code speed I have accomplished, they also allowed me this callsign. Ham radio is still a family hobby. I do NOT have "tit" for a callsign, I have W5TIT as a callsign, legally issued by the FCC to me. Get over it, you pompous baffoon.

Excuse me? Kim wanted IT (what?) to mean what? What did I say here?
Why, you must have seen me at Hamcom last year, Aaron. And, not only
that, but got up close enough to see what my *callsign* (NOT the word
"TIT") tee-shirt said. You should have introduced yourself! I would
have loved to meet you!

"Tit" is recognized by SOME as vulgar slang. Ummm, you must be a real
pent-up guy, Aaron. You know, real uptight? You know, real tense? You
know, high blood pressure territory? You know, Viagra user?

>

W5TIT is a legally issued callsign. Take it up with the FCC. I'm
uninterested and unaffected by your apparent disapproval of my
callsign. Oh, and I also wouldn't be so quick to classify you as a
"gentleman." But, my definition of a gentleman and yours are probably
two very different things.

Buhbye now....

This nice looking CB radio had(s) a serious design flaw which has affected all TRC-459 radios sooner or later. Radio Shack had to pull them off the shelves in the '80's. All radios would apparantly develop a "feedback loop" problem. I have owned 4 different ones and each had the problem. Troubleshootong was a nightmare. Can anyone explain the exact problem with the circuit board on this CB?

E-mail or post replies.

thanks,

Vince

mdwade wrote:
>
> BTW, Kim, is N5TIT taken?

Martin, at the time I applied for my callsign, I wanted K5TIT (which is already issued to a guy in Florida; so, uh, Aaron--what do you have to say about that? Shouldn't he give that call up?). Anyway, N5TIT was a possibility. The only problem with that is at the time there was a little riff going on at a local level and I didn't really want to be seen as agitating those whose N5 calls would have been right there with mine, as that was not the reason I got this call.

So, why did I get the call? Well, all "the guys" were getting their vanity calls and, at first, I was kinda not supporting the vanity call program. So, one morning on the local repeater I keyed up and I said something like, "Jeeze...if I got a vanity call, it would be a TRUE vanity call." They all knew what I was talking about and we ribbed around about it for a couple of weeks and then it kind of dropped. A couple of months later, I figured I would "join the crowd" and shock them with that call on the air.

In just about a year, heck maybe over a year now...Aaron and one other person are the only negative comments I have gotten on this call. It has disrupted contests with outbursts of laughter, it has put the shine back in our elder hams' near lifeless eyes, it has gently turned the corners of many a prudish gentlemen. And, I have enjoyed it.

73/Kim W5TIT

1133. VEHICLE ANTENNA SPACING

Newsgroup: rec.radio.cb

Does anyone know how far apart an antenna should be from each other on a car?? I have other radio antennas and want to be sure I don't lose the effiency of the CB antenna....

Thanks

>Excuse me? Kim wanted IT (what?) to mean what?

You wanted the word "tit" for a suffix of your callsign because of the reaction you would get using it.

>"Tit" is recognized by SOME as vulgar slang. Ummm, you must be a real
>pent-up guy, Aaron.

Nope. There is a place and time for locker room language. Ham radio should not be the place or the time. Unfortunately things are changing...

>You know, real uptight? You know, real tense? You
>know, high blood pressure territory? You know, Viagra user?

More insults Kim? It simply shows lack of character. Also a lack of a good argument. You have a vulgar call which you got on purpose. Why are you upset with me for commenting on it? Isn't attention what you wanted when you got it...

W5TIT, Kim Walker
>they [rules] also allowed me this callsign.

Rules also allow you to wear vulgarities on a t-shirt in public. Decent people usually don't though...

>Ham radio is still a family hobby.

Not really. I wouldn't allow my grandkids to listen without supervision. It wasn't always that way...

I do NOT have "tit" for a callsign, I have W5TIT as a callsign

Cmon Kim. Sure you do. Everyone knows you make words out of the suffix of a callsign. (W1RFI, K7JOE ect.) Everybody here picked yours out right away. You said yourself that you got it for that reason.

>Get over it, you pompous baffoon.

Gee Kim, name calling so early in the joust? Many of the regular (decent) posters have called me worse. I would think that someone with a vulgar call could have outdone them...

I think you certainly did. You started throwing terms like "old fart"
to describe those who don't agree with your perspective on things.

> Maybe I should have just said "Bigot". Look up the definition, and then
> try to tell me that many of these guys (including you it seems) do not

> hurts that much, maybe you should re-evaluate your point of view.

If I don't think the FCC's move was a good one and that simply does not
make me a bigot. It makes me someone with a very different opinion than
yours. Oh...what "truth" are we discussing?

> > > There's a difference between "liking" someone, and tolerating someone.

The world is also full of people who may agree with me.

I see it as you have 2 choices. Accept, tolerate, and
> understand, or stick your head in the sand and be miseable. Which will
> it be?

Hell, Dave--I have many more choices than that. I do understand. I
don't accept. I'm not sticking my head in the sand and I'm certainly
not miserable. See, I don't have to go by your list.

> As to liking me or not, that is your choice as well. I certainly won't

You don't seem to understand how things work. I not obliged to tolerate
you. I can respond to your posts as I'm doing now. As to my opinion
vs. your opinion--I like mine.

> > > > I sincerely hope that this FCC action causes a lot of old

I'm beginning to see a pattern here. If my view doesn't coincide with
yours, it's narrow, huh? You've used a bit too many metaphors for me.
As I understand it, you're a messenger for something or other and your
vision is of things swimming, walking and quacking which are not
chickens. This is starting to read like the book of Revelations.

> Whether or not someone "throws in the towel" or not is their own choice.

> over it, move on, or move out. Simple as that.

You're right. Getting out of amateur radio is an individual's own
decision to make. I certainly don't feel that many will take such
drastic action. If your inferiority complex doesn't allow you to
coexist with those who don't share your opinion, don't expect others to
vacate the bands just to salve your feelings. You see, no one is
required to move on or move out.

Anchildas must be some new Mexican dish with anchovies. I don't
question whether anyone will be a real ham. If an individual passes 5
wpm and the written exams, there'll be no doubt that the person is as
real as hams are ever going to get these days. What matters to me is
that person's on-air practice.

> improvements in technology.

Oh, B.S.! CW was and is a viable and popular mode. It is still in wide
use on the amateur bands. It doesn't matter a bit whether anyone in
commercial services use it. We aren't commercial ops. Anyone whose
license permits the use of CW should not have a problem demonstrating
some skill in its use.

At some point, we have to acknowlege that
> morse telegraphy is just as old and obsolete as horses and buggies. So
> at what point do we finally stop testing for it?

A good point would be when its use is neglible. We aren't even close to
that point yet.

Do we dogmatically
> continue to test for CW into the 24th century when people are Star
> Trekking around the galaxy?

I don't think it'll matter a bit to either of us.

No one is demanding "easier access" to ham
> radio, just access that is more in line with the technology of TODAY.

That is an outright falsehood.

> You can give me the toughest theory exam that is relevant and I'll study
> for and pass it, because that is what is required TODAY.

Me too--and I'll pass a code test to boot.

> I am a man of principles. I just couldn't see the relavance of CW.

...and because the light never dawned for you personally, CW was, in
your eyes, irrelevant.

> I refused to allocate slots of my precious time, to learning a skill that

Don't give me no jive about your "precious time". If you found time to
study the theory, you could have nailed the code. I'd hate to think

that I wasted eighteen years of something I wanted in order to wait for
a "gimme".

> It's unfortunate that the FCC didn't revamp the theory tests. They are

That's not nice. There are many dedicated employees at Radio Shack, and,
in an effort to serve you better, they will do whatever it takes to find
answers, even if it means leaving high school to attend college.

1156. FS: Stancor power transformers, NIB

Newsgroup: rec.radio.cb
Date: 2000-01-09 00:00:00 UTC
From: ovrreactor@aol.com-nospam
Message-ID: <20000108202721.03570.00001061@ng-fx1.aol.com>
Source record: 19005

I am selling a few Stancor power transformers, new in box, part number P-8365. Primary is 117 V. Secondaries are;

570 VCT (285-0-285) at 325 Ma DC
5.0 V at 6 A
12.6 VCT at 6A

The HV secondary is WAY beefier than anything in the AES catalog. And that's 400 VDC on B+, if you use a full wave SS rectifier circuit, or 800 VDC if you use a full wave bridge and ignore the center tap. (Obviously, lower B+ if you use a tube rectifier.)

SO WHAT if there's the filament secondary is 12.6 V! Just use half of that secondary for 6.3 V, and use a pair of resistors to ground to get the CT. OR you can use some 12 V variant "budget" tubes. I guess you could even use the 5 V secondary to run some 6 V tubes (or 5 volt variants).

There's a lot of different options for this transformer...just use a little imagination.

Asking $45, plus shipping (9.5 pounds).

Interested? Please respond by email to < OvrReactor@aol.com >.

Best Regards,
Tom Mitchell

Need some help from the ng...

I have a friend whose husband has recently died. He had a radio setup that he referred to as his "rig" but his wife can't tell if it's 10M or all/multi band. It is supposed to be a transceiver. He used to DX international, but her review of his log book doesn't give any clues. She said he never got a license so there's no clue there either.

She says that the name on the set is Galaxy Saturn Deluxe and it should be around 1992 vintage. The controls sound kind of standard, nothing out of the ordinary. It uses a Silver Eagle microphone and a T-UP9-DIOXSP whatever that is. Sorry, I haven't been around for a while and, although I have some knowledge of both CB and Ham, I'm not an expert and this is out of my league.

I'm trying to find out
a) What is this?
b) How much can she sell it for?

Sorry gang, but she's 400 miles away and this is the best I can do.

Really appreciate any information you might supply.

Thanks,

Ed

Why should it not be a problem, clearly an untrue statement
since after all I have a license that permits the use of CW, and yet I
personalyhave no such skill. The claim you are making here has not
been true for at least 9-10 years now. I expect it was not true for
some before that even. That is I firmly belive that even when it was a
requirement for license holders that there were many that could not
domtrate that skill.

As to popularity, it would seem that jamming profanity are
also popular in parts of the ARSm should we all be required to prove
our skill at those to

IYO. in mine and others a much better point is when it ceases
to serve a function whereby the prupose of the ARS is clearly advanced
by making all operators of certain prevelges donstrate that they might
have some skill, which is the current level of testing for Code

OTH it's use is neglible in the scheme of things, which is
where we come to issue of everyone else is doing. Morse Code use is
negilble in the world of Radio alone. It is the third or fourth most
popular mode in the ARS as a whole (behind FM SSB, and the digital
modes combined) It is number two in HAM HF, but a poor thrid to AM
and SSB, in HF as a whole. It remians the number one mode in CW
operattions without regard to the band they are in however.

>your eyes, irrelevant.

Indeed here I will conceed that you MAY have the beginings of
a point, alas THE BIGGEST PROBLEM CW advocates have is that they have
been unable to transfer this awaresness to anyone not amoug them. Of
course You still seem blind to the notion that perhaps, just perhaps
we are right and it is irelevant, and that maybe your adherance to it
is merely a quais religous one

Sir I for one am turely sorry that you were forced to waste 18
years of your life on anything. I futher assure that were it within my

power I would undo that for you. That you were treated in unjustly was and remains a tragedy for the yourself and the ARS. I and other see no reason however to contiue an injustice simply on the basis of your suffering. That "logic" would have meant that the US should never have freed its black slaves in order to prevent their ancestors lives and suffering from being wasted.

In adittion your assertion that having time to learn the theory is enough to also learn the code is plain false do you turely not know that?

I heard some talk on the CB in my area (Oklahoma City) that CB is going to be moved up to 400Mhz by the FCC in order to make use of the 26-28Mhz spectrum for micro burst data transmissions. Does anyone know if this is true? I sure hope it's complete BS.

For the first time ever I decided to throw a dead carrier. Turned up my Saturn turbo wattage and locked the D104. I took a shower and came back about a half hour later and my room stunk!!
Radio still puts out full power and it took an ice pack to cool the heat sink off. I had fun, so I thought Id share that with you all.

If I remember correctly, you were one of the people making comments along the lines that people who become "new extras" would not be considered "real hams", or would be inferior. To me, that is the same as "crowing"

> > No, I did NOT say that anyone that does not share *MY* personal views is

> > and non-prejudicial, was an "old fart" Maybe I used the wrong word.
>
> I think you certainly did. You started throwing terms like "old fart"
> to describe those who don't agree with your perspective on things.

Being open minded, tolerant, not being stuck in the past, non prejudicial and accepting of change is my perspective. If you wish to align yourself with people that are the opposite, then you are an "old fart". You may disagree with my perspective, and that is your right, but I believe that my viewpoint is likely to be more socially responsible.

>
> > Maybe I should have just said "Bigot". Look up the definition, and then

You can disagree with the FCC's decision, that's one thing . But if you look down your nose at people that have taken advantage of the FCC's "mistake", then you ARE being a bigot.
> >
> > Bummer! The world is full of people that may not agree with your view of
> > things.
>
> The world is also full of people who may agree with me.

Yes, and I'm sure that the members of the KKK think the same thing.
Because there may be a quantity of people that share your viewpoint,
does not mean that it's necessarily the correct one.

>
> I see it as you have 2 choices. Accept, tolerate, and

By complaining about something, you are displaying your displeasure.
You are obviously bothered enough about this FCC deal to motivate you to
let your displeasure be known, even though it will not change anything.
Maybe you're not miserable, but you're far from happy.

>

But you ARE tolerating me. By responding to this message, and continuing
this discourse, you are tolerating me to some small degree. If I can't
tolerate someone, I have to remove them from my presence, otherwise they
will cause me to get angry. I want nothing to do with an intolerable
person. I won't converse, or even allow myself to hear someone I can't
tolerate. I doubt if I make you *that* angry. I should not be that
important. Only people that matter should provoke strong emotions.

The pattern is that if you have nothing to say, that could deny the
statement, rip it apart for style.
The point is still valid that if "old time" hams cop an attitude with
newcomers, simply because of the new requirements, they are displaying
prejudice. If you fit into that group, then you are as well. If not,
then this doesn't apply to you.

>

> required to move on or move out.

I have no such inferiority complex. If someone cops an attitude with me,
they'd better be prepared for what comes back. And I'm not the one that
"expects" anyone to vacate the bands. I'm just repeating some of the
comments that I've heard. I can remember the "old farts" that I heard on
the air, belly-aching back when they started novice enhancement. They
couldn't STAND the fact that novices were getting phone privileges on 10
meters, 220 and 1296. Many of them stated that they were going to sell
any equipment that they had for those bands. They didn't want to
associate with novices. They felt that they were somehow "better" than a
novice. These same people pitched a bitch when the no-code was passed.
THESE are they types of people that I HOPE throw in the towel. I'm
sorry, but no one needs to be subjected to THAT kind of attitude. Ham
radio does not need people that discourage newbees. Ham radio needs more
elmers. I can't make these people leave, but I can HOPE that they get so
disgusted, that they leave on their own. *MY* feelings are not the
issue. Like I said, someone like that will get a verbal dressing down
from me if they cop that attitude. I'm just concerned about newcomers
becoming discouraged and leaving the hobby with the impression that
ALL hams are like that. I want to go on record as saying that I
welcome any newcomer, and will help them out as much as I can.

>
> > >

>
> Thanks for permitting me to stay. I don't know if I'll be able to
> contain myself as far as the preaching if the guy designing the
> algorithms is a lid on the air.

And there it is. That little prejudice. You believe, deep down inside,
that lack of CW proficiency automatically makes this guy a "lid". You've
already formed an opinion before you even get to know them. THAT was
what I was talking about.

You'd just better be careful that this guy doesn't think that YOU'RE the
lid, for wasting time learning an obsolete telegraphy skill rather than
becoming proficient in modern digital communications techniques.

>

That's fine. But if you look up the guy's call first, and discover that
he's a "new general/extra", and then expect him to be a lid, you're not
being fair.

> > >
> > > > >
> > > > > Neither a license class nor a callsign will make you other than you are.

>
> Again, you don't have the privelege of deciding that. What I think can
> only be irrelevant to you.

As far as the subject of whether someone is a "REAL" ham or not, you
opinion IS irrelevant, since the FCC (the only voice that matters) says
that they are.

> > > Dave, I've passed all the written exams and a 20 wpm code exam.

> play the game of political correctness.

No problem, make your feelings known. But it's still a done deal, and
nothing you can say will change that. So any "venting" that you do is
nothing more than "sour grapes". So what remains is how you are going to
deal with the new people. Will you give them the shaft, and tell them
how "inferior" you think they are, or will you give them the benefit of
the doubt and help them in?

>

> some skill in its use.

The only reason that CW is used at all is because we dogmatically
insisted on requiring it. If the commercial sector has abandoned it,

wouldn't you think that they had a good reason for it? I predict that
now that 5 WPM is the limit, that CW usage will drop off dramatically.
And THAT is what scares the "CW forever types" the most. Less usage
means that eventually the FCC will reduce band space for it.

Study? Who studied? I could pass the theory tests, drunk off my ass,
after 36 hours of no sleep. I live and work with this stuff. Code, was

not something that I needed, wanted, or had time for. I wasn't about to take time away from my many projects to learn a skill that I never intended to use. It makes no sense to do so.

Basic VHF, yes. But in order to get world-wide coverage (like the
internet offers), you have to set up a more elaborate ham station. You
also have to be cognizant of DX conditions, and the availability of DX
stations. It's very much hit and miss.

The reason that it only hums during transmit is due to the fact that the radio draws its maximum current in transmit. If the power supply is not "up to snuff" and is sagging, you will get a ham on transmit. Do the meter lights dim? Try running the rig on an external supply. If it's ok then, then you know that you problem is confined to the built-in one. Check your supply voltages. If they drop more than a volt or 2 when you transmit, there is a problem. Looking at the ripple on a scope should not show more than .2 volts on the raw (before the pass regulator) DC side. The raw DC should also be at least 6 or more volts higher than the regulated output, to provide enough reserve voltage while transmitting.

I'm assuming that the "hum" that you're hearing is a 60 Hz A.C. hum. If it's more like a "squeal", that might be an RF feedback problem, and would involve the mike audio circuit.

if they are 100" apart (like on the mirrors of a big semi) that works the best. For on a regular truck, at least 4' apart is ok., but you will be very directional. Make sure you check your SWR's carefully with each antennae

I would get one that had sidebands or upper and lower channels. As you talk on the radio, you will want more and more things on the radio. I would say stay away from the noise toys (it gets annoying to other CB's).

No need to be a smart ass. I was not trying t sell anything. My k-40 has been through 2 years of hitting trees, roof at drive through windows and even the roof of a couple of parking garages and other than replacing coax never one single problem. I have borrowed a friend extra wilson 1000 for a week to decide whether to buy one and noticed no difference at all. Whether I sell or not has nothing to do with the subject.

You need to do something with your antennae and coax. 2.1 without the amp is to high. On a SWR meter, it should not be over 1.5 (I have mine tuned to 1.1). Make sure that the antennae is ok, that it is not split anywhere, also check the coax. Hook your linear up in your other vehicle, and see how it works in there. Again make sure that your SWR without the amp is 1.5 or lower.

Sorry, but that isn't true.

The military recently bought a lot of morse code tutors from a
manufacturer, and at the present time I'm working on a PA especially
to boost the output of a back-pack digital transmitter so the
operators can switch to CW!

Yep, CW is right in the specs.

Now that doesn't mean we should be required to learn morse code in
case we have a little war, but it does prove the people who use
arguments like those above often state what they "think" is going on.
Of course that isn't necessarily what is really going on.

CW is a very reliable mode for exchanging information when other modes
won't make it through, and doesn't require a lot of supporting
hardware.

Like doing math with a pencil and paper, it will always have a place.
Especially if the amount of power and equipment available is very
limited, and communications is important.

The only problem I have with the amateur exams, and how the exams have
been changing, is how they are m,ore and more becoming a test of
memory and not actual knowledge.

The people who "just can't get the time or skill" and are waiting for
a free ticket have a right to enjoy the dumbing down (thanks partially
to Kenwood, who should have been excluded from input into amateur

affairs because they have a profit motivation).

But they should just keep one thing in mind.... many eight year olds (and younger) can obtain the highest class ticket under the present "testing".

The problem with amateur radio slacking off isn't the testing, it is a social change. We could give the tickets away like the ones received by filling in the forms that came in a CB radio box in the 60's, and we still won't get a bunch of new hams.

The only thing any of this will do is let the people who are too lazy to study upgrade. A lot of people will move up in class, but you can bet there won't be any great increase in numbers after a little initial surge.

This is a free pass to an Extra or General, and has nothing to do with fixing the social problem of people not being interested in how things work, working, or radio communications.

If anyone thinks this is a plus for all of us, they probably should think again.

73 ,

Tom W8JI

1200. K40 parts inside?

Newsgroup: rec.radio.cb
Date: 2000-01-09 00:00:00 UTC
From: John Amero <" johnaNO§PAM"@island.net>
Message-ID: <3878727A.115AEE36@island.net>
Source record: 19049

I have a K40 roof top mount now and one with a cracked top where the whip goes in. I am thinking of getting the Wilson 5000. I like well built antennas.

Question... I can find a cutaway on the Wilson and see that it is simple and strong but I'll be dammed if I can find much detail for the F40 like the wilson... even at the Mfg.'s web site.

Some one mentioned that there is a Capacitor in side as well as the coil. Is that true? Can come one set me straight on this?
Please email as well.. watch the spam blocker.

Thanks,
John

I'm not the official spokesperson for anybody, Tim. But, I do feel I
have a right to post an opinion on these subjects (just like everyone else).

By the way, Tim, what's your last name? I have a friend who lives
Bayou Vista TX, not too far from Marlin Street. In fact, you may have
even went to school with his son - he's about your age (19). Of course,
that depends on if you went to school in the area since moving up from
South Texas.

Anyway, take care.

>Some one mentioned that there is a Capacitor in side as well
>as the coil. Is that true? Can come one set me straight on
>this?

The K40 is a series fed antenna that has no DC connection to
ground. What it does have to ground is about a 100 uuf capacitor
that is attached at the bottom of the coil.This capacitor is the one
that can overheat and blow with a power above 200 watts.

The Wilson, at least the ones that i'm familiar with, are shunt fed.
Instead of a capacitor going to ground a extra portion of the loading
coil goes to ground. Therefore it is DC grounded.and has no electronic
component that can overheat as easily.

P.S. If the Wilson antenna is magmounted then it is not DC
grounded, even if the feed scheme appears to do so.

Nick,

I think suggesting people who take pride in acomplishments should
simply forge their acomplishments to save work is a very poor
suggestion.

I can't imagine why that would make anyone feel good about themselves.

>While scalding, that was very well said Nick. I indend to get my license
>someday. This is a very VERY new interest of mine, and I go into this
>interest late in life at the ripe old age of 26. I'm going to be taking

>remarks while scalding, are well said...

Since you think Nick spoke the truth, Does that mean you intend to
forge a license, as Nick suggested?

This all seems very strange to me. No wonder its so difficult to find
skilled help today. I'll have to check closer and see if the
credentials are forged or real. I had no idea this was going on.

1216. Re: K40 parts inside?

Newsgroup: rec.radio.cb
Date: 2000-01-09 00:00:00 UTC
From: Jay <jay123a@qnet.com>
Message-ID: <387877DD.3A3D07CA@qnet.com>
Source record: 19065

Hello John: Yes there is a capacitor, it is a (low quality, mass production type) 130Pf disc capacitor. This capacitor is the week link in the K40 antennas!

After buying a K40 in the 80's, I burnt mine up! I returned the K40 to the CB dealer and they would gladly replace it for free. The lady behind the counter, takes my burnt up K40 base assembly, and throws it in a large box of other burnt up K40 base assemblies!

I ask "What's the deal, with all the burnt up K40 antenna coils!?"

And she replies, "There all burnt up!"

I says, "Please let me have mine back, and I'll ah fix it myself!" Full well knowing I'd go for weeks with out a mobile CB radio, which is totally unacceptable, if I wait for a replacement!

She says, "Ok but no one has ever fixed a burnt up K40!"

I says, "Well I am a super CB'er, and I can fix stuff" With my ball cap now positioned at 22.7 degree's off center from my forehead center, a strange look, and my burnt up K40, that looked like a burnt up K40, I go home.

At my CB shop at home, (the garage) I take the K40 apart, and find a 130Pf disc capacitor burnt up. I replace the mass production cheapie with a 130Pf mica 1000 Volt capacitor. The old mass production cheap coax RG-58 is replaced with RG142B, a Teflon type of bullet proof coax. The plastic assembly is repaired with a epoxy from the hardware store.

The K40 is reinstalled and works fine, but looks like it took a direct hit from lighting. For my other car, I bought a Wilson 1000, it has no capacitor, because I replaced the cheap mass production coax with the good RG142B bullet proof coax. And it doesn't get burnt up!

Hope this helps a little.

Hello Bill: Better look again! Look at a 1 wavelength antenna with
elevated ground radials at say about 30 feet off the deck, on Eznec.

Actually it would be like requiring them to communicate in latin. It was of use at one time but no longer has any practical applications.

See? Now you get to the real point, which is that you think this is a
joust. You pompous baffoon. OH, by the way...you want to know what
phonetics I use on the air for this vulgar callsign? With adults and if
I feel they will find the humor in it, I use "two in tow"

How can you say that? With any given spacing the result is also
dependent upon the phasing and adjusting the phasing can make antennas
behave the same as the ones at a different spacing.

Ah, but we're not talking about body parts, we're talking about language and how it is used. If there were no sexual intercourse there also would be no homo sapien families. Does that make it OK to use the word "F***ing" in a family setting like ham radio...

I disagree. It is amusement solely for the kids -- just like
farting. Personally, I don't find it humorous. And, only a few
old men find it vulgar. (If we spell it "teat", then it is not
vulgar -- how about W5TEAT?)

I could understand that this was how these *old* men were raised,
but how do they continue with these views about vulgarity? What
is the logic behind it?. What is vulgar about "tit"? I guess
these are the same folk who make it unlawful for young women to
go topless.
It's not about family values, it's about the prejudice of *some*
old men.

The body part not obscene. The word is inappropriate in certain settings.
I'm sure my grandkids use it on the playground, but not in the classroom, if
they know what's good for them. There is a time and place for locker room
language, and ham radio is not it...

Sheesh, why didn't *I* think of that. That's exactly right, Michael.
Vulgar is in the mind...or lack thereof. Thank you.

The hum is from the power supply. Open the radio and splice a noise suppression filter in line with the positive wire (usually red) from the power supply to the radio PCB.

First, if Kim went "topless" on radio, would you know?
It's up to a woman (young or old) to decide on toplessness, etc.
It's not up to men, regardless of whether they approve or not.

No, I made the comment to Aaron that, when I feel the situation allows, I have (twice...once on 2M and once on 10M) used the phonetics "two in tow." Now, that a kid could distinguish my humor does not mean that *I* am the one who has given him that knowledge...but Aaron seems to think so...

But, you're right about Aaron needing to get a grip...maybe that is what his problem is...no grip, nothing TO grip. Now, THAT, Aaron, was "implied" vulgarity. Do you get it?

Backtracking now? Since you counted the times you did it, you obviously knew the vulgar nature of your on the air dirty jokes...

>Now, that a kid could distinguish my humor does not mean that *I*
>am the one who has given him that knowledge...

Most kids already know most of the dirty words. That doesn't mean responsible adults should use those words in front of them in a ham radio setting...

Sunspots yes, increase in skip yes, it's just conditions. you have trouble talking locally, contact someone thousands of miles away to relay your message. I did that with 408 in Indiana from EL Paso, I could hear him and he could hear me, neither of us could contact local radio stations so we relayed one another messages from one area to another and so did the other operators. Works great.

Admittedly, I like topless young women. And, heck, if society
didn't make it illegal and irrationally treat it as "dirty", then
I would see more of them. No, I'm not interested in the
professionals. So there, that's where my mind is. Nonetheless,
regardless of your desire or mine, I do not think that *men*
should be deciding whether women should be allowed to go
topless. Let them decide for themselves.

If it looks like something else, it probably is. You're talking
RadioShack here, not Wireless Marketing.

>I have a K40 roof top mount now and one with a cracked top
>where the whip goes in.

K40 will replace the whole load section for $10.00 , and they pick up shipping to your home and give a free replacement warranty for 5 years .They told me on the phone that the plastic used for the load has been changed , maybe they did or maybe not but for 5 years it will be covered . I have seen the antenna hold 400 watts all day long with normal use , they say 500 watts , but I wouldn't trust that .

No, no, no....I wasn't recommending that a LICENSE be forged. Just put a piece of paper with some bogus writing in a nice frame, hang it on the wall by the expensive rig (I didn't say that he needed to USE the radio), and then the gentleman can have ALL of the satisfaction which he appears to derive from his amateur radio license: A FANCY, OFFICIAL-LOOKING L_A_B_E_L, nothing more. No need to even power-on the rig!

He said it himself, the LABEL has lost its value now that it doesn't set him apart anymore (after restructuring). I'd like him to have a nice, fancy, official-looking label again, so he can feel good about himself again. If he does what I suggest, he can have the nice, fancy, official-looking label back, but without wasting all of that time on the distracting AMATEUR RADIO stuff.

> >While scalding, that was very well said Nick. I indend to get my license

>
> Since you think Nick spoke the truth, Does that mean you intend to
> forge a license, as Nick suggested?

No, it means that he's getting his kicks from RADIO, not from the piece of paper. It means that he can tell the difference between a superficial label (a piece of paper) which says "amateur radio" on it, and being an actual amateur radio enthusiast (unlike the gentleman to whom I was responding).

I am looking to purchase a radio. I have been into 11m radio and such for quite a long while. Got into freebanding about 15 years ago. Since then I have totally gotten out of the "regular forty" radio. This has got me out of the loop so to speak. I have not bought any new equipment for about five years. The problem that I have come up against is I am not sure what radio to buy, or where to buy it.

Here is what I am looking for. A simple to operate no thrills radio. It must have a rf gain and a mic gain, this is it for features. It must do am and fm, ssb is not necessary. With this comes sound quality. The am must be good, not necessarily booming am but loud enough and most importantly clean. The fm must also be of quality and clean for we do use it here locally. Lowers(below 26.965) is a must but that is all.

The radio that comes to my mind is the
Super Star 3900. I am looking for some other opinions and ideas. Also any ideas on where to buy this. I am looking for a place that will open up the freqs, tweak the audio and say it is ok. With this I will be purchasing a Wilson 5000 and if all goes well a repeat of that radio in the next couple of months.

President James.

Best AM / FM radio to come across my bench yet.

Solid performer with an 18 watt AM/FM transmitter (true 18 watts, with 40 PEP watts), 120 below one, 80 above 40, good RX section.

Toll Free

"Tit" is an acceptable word on British television. If I'm not mistaken, it's
even an acceptable *sight* on television in parts of Europe. Of all the
so-called "vulgar" (look up where that word came from sometime!) words you could
complain about, you seem to have picked a really lame one.

Transistors and IC's are made from smoke. Above a certain temperature,
the smoke decrystalizes, and becomes visible. If you let the smoke out
of the parts, they don't work anymore.

Just a wee bit curious about something. If the FCC decides in 10 or
15 years to eliminate all testing requirements for a "Ham" license,
would you be in opposition to this policy? If your answer is in the
affirmative, what would be your answer to a new age "ham" who might
berate you for being an old fashioned intellectual elite snob?

Stax

the nasty fear giver rides again.....

This may sound dumb, but check the RF gain. Somebody brought me a
radio to fix once for that problem. He had the RF gain turned down.

Source record: 19176

Use accurate logic....with all of the hundreds of thousands of Cb radios out there running power, a large portion of which would certainly devote their lives to dis-rupting these data burst transmissions on 27mhz, how could these data transmissions be realiable? They could not...and if high powered jamming did not take care of these signals, then the skip would.

27mhz is the closest thing to hell you will find on the airwaves...nobody in their right minds would put any kind of data sevice there.

Dave!!!

Jeffs e-box!! wrote in message
<18187-386D2859-36@storefull-215.iap.bryant.webtv.net>...
That is the prettiest gift wrapped piece of BS that I have ever seen.
First of sir I nor does any other CBer need your or any other
egotistical kilosyco ham operator, invite to join the elite. First of
all I am a ham operator and if I ever run out of toilet paper you guess
what the first replacement part I look for. I have found the ham service
to be plagued with far more problems than the CB band. Between the
obnoxious contestors, the rude channel master with the clique in crowds,
interference from broadcasters and generally rude behaviour you can have
all of the HF amateurs that you want. Please I will not even begin to
start on the above 30mHz asses, this post could go on forever. Their
list includes the HF list plus two more pages.
Now at the same time I have little use for CBers also. That is to say
that over modulated, roger beeping, more power, more power, more power
fools. You know, my radio bleeds 60 channels in all directions, my
neighbors tv looks more like a o-scope than a tv and I aIways can get
another kw if they dare complain again.
We all know both types from both services.I do use my Ham license
occasionally and I do go into the cb band also. but I have found the
best group of operators to be found on the outbands of 11m. Above 40
some true ssb dxers with stations to rival the nicest 20m contestors.
The below 1 group is a bit more am inclined and seem to be more into
conversational radio with great groups that meet everyday, topics on the
technical end and just some old fashion people talking. It is great.
I took all of this space to say if you are a cber thats great, if you
are a ham operator great or just a plain old outbander great also. Why
does it have to be he is right or I am right, this is better that that.
Better to all, is you do your thing I will do mine. If I run into you
doing yours as I do mine, lets shake hands and move on. To the people
that want to look at the legalities of this and point a finger, please
look at all the facets of your life and then we can talk. Even if we
find the person that can live blameless, how blameless is a person who
finds it necessary to point the finger, to him I give the finger.
one last thing to the one person that reads all of this bullshit, thanks
and great radio to you.

from the grey matter
of
Jeff

Look for the handi-finder on the web,with the antenna on it set for 2 meters it works great on 27MHZ but you need to use an FM reciever.This is a TDOA type of finder and if this unit isn't found any TDOA will work.

Loop sticks also work good.

World Amateur Radio Conference(WARC) held in '79.Amateurs got 3 new bands,12(24MHZ),17(18MHZ),30(10MHZ) Meters.These are GREAT bands and all radios after '80 have them as well as some '79 models(TS430S,757). These are also the years when radios became transistorised and got features like scanning,split trancieve and memories.I woild not get an HF rig older than this for any price.

>would you be in opposition to this policy? If your answer is in the
>affirmative, what would be your answer to a new age "ham" who might
>berate you for being an old fashioned intellectual elite snob?

One I would be in oppsititon to this sort of policy, but I
conceed some similarities. However the charge that those who suport
the then Old order as intelectuals, come on If such a movement comes
into to being I do hope for their sake they pick a better slur than
that, nobody in anything close to thier right minds is going to call
our testing procedure excessively intelectual. While I did and do
adknowledge some simlairities between the idea of NoCode and No Test,
there are big differences. One we test on rules rules knowledge in
part, something that will always be defendable by the FCC. Two we test
in part for things related to safety issues, this will also be
defendable as in the public interest. Three the current tests (i'll
not say what they are like in ten years) are not so hard as to be
burdensome on people. These three things mean that Code and the
written materail, are always going to treated differently since can
without code knowledge, operate legaly and safely, while assuring
legal and safe operation without any testing is much harder. That said
I am of the school that says , IN AN IDEAL WORLD that WE DO NOT have,
I would favor NoCode No Test, thus I view testing as a neccesary evil,
not as a good thing in it's own right. I do conceed it is possible to
chalenge the testing of anything more than a very minimal level, in a
legal sense, today. that is one CAN argue that much of the materail we
curently test for is not clearly within the power of the FCC. I do not
care to make that case, and I believe it can be beaten but a case can
be made

1339. cobra 2000GTL freq. counter

Newsgroup: rec.radio.cb
Date: 2000-01-09 00:00:00 UTC
From: Jerry Fernholz <N/A>
Message-ID: <947485604.319713@news2.bigplanet.com>
Source record: 19188

I'm looking for some help in repairing the frequency counter on a cobra 2000. It reads 92.0 on channel 11(Actually receives and transmits on channel 11) and 0.0 when keyed up or on side band. Any ideas what to probe or parts to replace?

Jerry

Dave, you still can't pass 5 wpm much less General, stay with 27 MHz,
1.8 MHZ to 29.700 MHZ in 9 HF bands and you would not know how to act.

I didn't understand him to say he was proud of the paper and ink, I
understood him to say he was proud of his efforts.

I'm not sure what the politically correct view of people who take
pride in acheiving goals through work is today. It may have changed to
the point where being proud of accomplishments is consider a flaw.

My opinion is probably out of date, at least according to the Ted
Kennedy school of water rescue standards. But I think he has every
right to place value on what he has earned.

IMO, suggesting someone forge credentials to be "proud" is shameful.

400watts all day long I've seen , $10.00 and K40 will replace your whole load section and give a 5 year warranty on it plus pay shipping to your home , just send them that old load that was laying in the garage and have a new antenna again .

Oldmantube

,,,,,,,,,,,,,,,,,,,,,,
I found out long time ago that if you cut an additonal 1/2 inch off the bottom of the k40 whip, it would take more power. Used to run an elkin super 8 tube (1000 peak) thru one. For some reason getting the bottom of the whip up higher away from the capacitor in the coil allowed it to handle more power. never burnt another one after that. I would much rather use the Wilson 5000 though. heavier duty coil and more signal output.

Anyone out there have one of these radios yet? If so did you mod it to work on 11M? I assume that the RCI 2950/2970DX uses the same CPU and PLL as the old 2950/2970s. They did however improve the receiver by adding a dual FET mixer and did other improvements to the receiver. I also assume it is essentially the same as the old 2950/2970s other than the receiver improvement. If you have more information or differing information on this radio I would appreciate it if you would email me about what you know.

Thanks,

John

friend, i've been saying this for months.
all that you'll get from the rf police types around here is that "i had to learn it, you must too!!!. and "it's the rules".
my question is if it were a requirement to walk on hot coals to join an elite club, would you do it or would you hang around the fringes?
personally, i'm happy hanging on the fringes waiting for the fire to die out completely as some day it finally will.

>there instead of using FM).

what ever happened to broadcast am with it's recent expansion up to 1700 khz
and the comming of am stereo?
you also have your video on your tv comming through on am also with the audio
on fm.
have a good day.

>There is a use for it as long as it uses less bandwidth than the voice
>modes

the ham bandwidth is like unlimited petrolium in a world full of mopeds.
there's so much unused bandwidth in the ham domain that bandwidth really
shouldn't be a problem on most bands.

>and besides,it's fun

all well and good for those of you who enjoy it. it shouldn't be abolished,
just optional.

>The Army doesn't use jeeps anymore but a lot of people wouldn't drive
>anything else.

Message-ID: <Zpce4.141$wF2.12190@server1.news.adelphia.net>
Source record: 19217

I'm recently purchased a Midland 77-115 that I'm going to place in my 98 Neon R/T. My question is, has anyone had exp with a CB rig in a Neon? Specially a good spot to mount the unit? Also I currently have a Wilson 1000 mag mount that I'll probably use for my antenna. My question is rather then worry about the paint and other mag mount problems, where could I get a adapter to convert my Wilson to a trunk mount? I know that the center of my roof would be the best spot for the antenna but for looks sake, I'd rather it be off the back.

Thanks

I purchased a used 148 Cobra trhat had extra channels already installed. The problem is the limiter has bee removed. I think it is TR-24?? It is a 3 leg one. It is distorting on SSB unless I turn the mic gain way down. This is a hassle. I would rather have a limiter and be able to adjust it wo it wouldn't be so touchy.
Wher can I get a new limiter to put in it?
Thanks.

2 watts dead key if you don't want to burn out the variable
control. Since the unit has one 2290 driving four 2879's, you
don't need a lot of dead key.

DB transmissions are normally PWM or PPModulation
normally running about 1.5 to 50 kw peak back in the
1950s to 1960s in old government setups.
Today the base setups usually run 15 to 100kw peak
with a average output of 1 to 100 watts
and mobile units running about 1 to 8 kw with a average
output of .1 to 1 watt using Direct Sequence SS or WideBand FM
with tx times of 1/100 to 1/10 second at 1 to 100 Mbs.
Mobiles use a big computer grade cap 60000uf to 120000uf that runs a
class E amp using a FET or two. all you need to run it is a
15 awg wire and a 3 amp fuse.
pause between TXs is about 10 to 15 seconds minimum
witch allows the cap to charge to about 40 volts from
the 15 to 40 volt DC to DC converter.
Bases run about 1/2 to 10 seconds between TXs
It is normally used with vehicle monitoring and locating systems
to extend the range of normal ground wave communication.
This allows base units to be spread wider with out any gaps.
of coarse i am referring to high power DB transmitter setups
not the normal cell phones and other wimpey junk like
wireless networks packet and other stuff.
A old 1960 tube type PPM 990 to 1040 MHZ cavity amp with a
output of 1.5kw is only 3.5x4.8x3.5 and is only 4 lbs.
it has a 3.5kv pulsed plate voltage input with a 2c39a tube
and I know technology has came a long way sense then.
the only problem is there is not that much bandwidth to work with
the max data rate would be about 1.5Mbs witch would cover
a band with of about 25 to 28MHZ.
It would be a neat idea.
Just think about it when the band is open you would have
a world wide data network with no local cell sites to worry about

in the pacific ocean or antarctica you will always get the email =:)

> micro burst data transmissions. Does anyone know if this is true? I sure hope
> it's complete BS.

This rumor has been going around, in one form or another, for ten years. Yes, if the government allowed micro-burst data transmissions on the Cb band, it would effectively end all reasonable communications (you might be able to talk to others on your block over the mind-scrambling noise).

Micro-burst data transmission are generally frequency-hopping, error-correcting, digital communications. While you might be able to jam one located very near you (and cause it to switch frequency), you would certainly not be able to communicate over any distance on that frequency due to the endless pings from other transmissions (checking to see if the frequency is free).

However, having said that, there is not a thread of evidence that the government has any intention of doing this. There was a request from some company years ago for frequencies in the upper HF region for this purpose (which may be where the rumor came from), but they ended up somewhere in the 800-900MHz region.

Ok It is Fun but there is something that will rival code in
bandwidth and have the sound quality of FM. It's called digital Voice
Mode and it possibly will make it's appearance in some sort in the
near future.

A CB in a Neon R/T ?!?!...please reconsider, get the souped up exhaust
system, get a new race ready head... WhatI am trying to say is leave the
Neon alone in the CB dept. *Sigh* but if you must put in a mobil rig, try
in place of the ashtray. On my old 87 Shadow(I know poor comparison) I got
a second ashtray bracket and hacked it up to work as a bracket for my
Cobra 19+. It was a solid mount and I saved the interior from drilling.
Hell it looked factory, Nice and clean! Plus when I resold the car I just
popped in the old ashtray and it all looked like new
Thats my two cents. Just be sure to mesure first and take into account
any ducting(a/c, heat) and insolation. I can honestly say I don't know the
dimentions of the radio in question. However it may work for you. Now I am
no help in the antenna question I use K40's lipmount :)

Please read all of this post.

1. I have a WORKING Realistic TRC-458 which is a 40 channel CB base AM/SSB radio that I am selling for a freind. The radio has some scratches. Has NEVER had any extra channels put in it.
Great radio, as it can do over 200 channels. Info on the net. It has the 858 chip.
Full service manual included (a $ 20.00 value) and a brand new separate 858 chip (spare), spare relay.

Sell both for $ 65.00 plus shipping.

Picture avaliable for the TRC-458 ! ! !

2. A TRC-449 mobile CB radio (same board as the TRC-458) for parts.

no mics

Please reply to email as I do not often get to this newsgroup. He wants to get this stuff sold ASAP, so please reply ASAP. I will reply to you from Monday to Friday only.

Thank-you,

Don't take offense by this but you should probably ask for help.
I personally have never known a HAM who was not interested in showing
off his station and recruiting a new licensee.

Secondly, If you go about the pursuit that you might find a HAM with an
attitude, it seems that you are looking for what you what like to avoid.

Bottom Line! Do some research and you will find someone local to help
you through it. If you enjoy two-way radio, it is well worth it!

Good Luck!

Oooooohhh, Logic! I love it!

Yes, if the FCC decided to abolish ALL testing, I would very much be against it, as I feel that in order to be given the responsibility of running a high powered ham radio station, that you should be able to demonstrate that you know what you are doing. I believe that the testing should be periodically updated to reflect advances in new technology, as well as remove obsolete technology, and of course, FCC rules and regs. Right now, as I see it, Morse code is obsolete technology. Sure it is still usable to those who have an interest, but it is not necessary to know to operate a ham station.

Just as I would think it nostalgic and neat to build a simple AM tube transmitter 40 years from now, and use it to "relive the old days", the technology to make it, should not be required to know, for testing purposes, if all the common modes have become digital. It becomes optional, just like CW should be. If you want to use it, use it, but it shouldn't be required.

> parking ticket?

You bring up a very good point, and one that I agree with. I have never been a fan of the VE system, as I know that the temptation by the average citizen to abuse the system is just too great to allow them to be trusted with the responsibility. I personally know VE's that have "slid" people by with both theory and code tests (In fact, I was offered a code "test" by one group, which I politely declined). I know of other groups that do it for money ($200 for general, $300 for extra).

Back when the FCC administered tests, you had to deal with the inconvienience. You had to go on THEIR schedule, you had to wait to retest, and it was very difficult to "cheat" the system. Only the truly dedicated would put up with this, in order to get their tickets. Maybe if the license fee were re-instated and set at a level of something like $50, the FCC would not be so quick to get out of the administrative department, and the "quality" of the ham would be much better as a result.

But in today's air of "instant gratification", many people are too impatient to go through this exercise.

Is ham readio dead? No, but it is losing its uniqueness, and sterling quality.

Yes, but look at the other side, with the testing requirments as they
now stand, a person with substantially LESS technical knowledge, skill
and discipline can obtain a high level ham license, with little actual
work. So the "value" of the license has been degraded, since it is no
longer necessary to be a "tech whiz" to get one.

> But it seems that this isn't enough for you. You crave that piece of paper
> which says "Advanced" or "Extra" on it, not because of what YOU are and
> what YOU have accomplished, but rather because of the mark the LICENSE

It's no different than the bogus network "certification", that
Mickey-soft and Novell started for computer professionals. It's a piece
of paper, that says that you know something. The difference is that MS
and Novell are making big bucks off of everyone that studies and takes
the test. But it's only worth something if you recognize the validity of
the testing methodology.

Once upon a time, a ham license looked good of a job application or
resume. Participation in what was then "the" technical hobby, was a
testimony that the job applicant knew enough to pass the tests, which
meant something to a manager looking to hire technicians or engineers.

Today, that is no longer true, except for some specialized
communications fields.
>
> If that's all you want, just have a fancy, official-looking embossed piece
> of paper framed and put on the wall next to your $3000 general-coverage
> receiver. Only a tiny handful of people will know the difference.....
>

Maybe we just want to make sure that everyone who plies the ham
frequencies has enough technical knowlege to keep them out of trouble,
and enough responsibility and maturity, that they won't cause trouble.

And it is still true that the value something has, to its owner, is
directly proportional to how much effort one had to expend to get it. If
you had to apply yourself for the better part of 3 or 4 months preparing
for, and passing the test for a ham license, you will be less likely to
abuse the privilege, than someone who just signed on the dotted line.
That's human nature.

You're thinking of the Cam 88. The Cam 89 looks pretty much like the current day 142 GTL. I had 23 channels, a separate modulation and "S" meter, the woodgrain "look" cover, and the sloping front panel with controls.

I was recently informed of this as well. If you go to the FCC.gov page
and look to Bureaus/Wireless/News_Releases/1995/hrw15023.txt, that will
explain the situation. But it does not go into specifics, such as who is

authorized, whether or not there is a license, and what one has to go though to get one. But it almost appeared that the FCC was simply saying, that they don't care if "landlubbers" operate on VHF marince chanels inland, as long as they don't interfere with marine operations.

So this is what I have to look forward to, huh? I'm sorry, but I resent the hell out of your sentiment that every new ham is an "idiot" or a "CBer". I am studying for my Technician's license (ready to take the test at the next hamfest) and look forward to advancing in the amateur radio service, despite the less than gracious welcome mat that you folks have laid out. The focus of Amateur Radio is helping people through the understanding and application of radio communications theory. From what I've seen, other than relaxing the CW requirements somewhat, the FCC hasn't lowered the entrance requirements to the point that it doesn't require hard work to attain the various level licenses.

I'm not meaning to single you two gentlemen out, I've been reading similar posts for awhile now and decided it was time to speak up. There are some of us who are just getting started in amateur radio that could use help and encouragement from the more established hams. I understand your anger, but you should be careful not to do more harm than good by callously tossing out such comments. Dig out your ARRL Handbook and read the Amateur's Code, based on this and similar recent threads we seem to have lost sight of something important.

Respectfully,
Mike

This message is totally hilarious. Can I have permission to post it in the ham radio newsgroups? I've never seen a message that contained so much absurdity and self-delusion before. I'm sure they'll get a great big laugh out of it.

By the way, who is the "radio designer" in rec.radio.cb? And is this the same person who has the "advanced operating skills?" There is indeed a lot that we can learn from an individual such as this. Besides, perhaps there is somebody in the amateur radio newsgroups who will want a radio designed by this very advanced individual.

And look, there are actually CB'ers responding that seem to believe this nonsense. How insane! No wonder most CB'ers are not taken seriously.

Hi,
Ive used a K40 on and off for 20 years and if the coil goes out they will
replace it for 10 bucks. K40 will hear better than a Wison 1000 in side by
side tests that i did but will not transmit as loud and not take as much
power as the Wilson but at 60mph are a lot easer to hear in the Mobile
because of a better signal to noise ratio.....
There is a picture that comes with a new antenna that showes you the break
down of the antenna and how to install it for different applications, so if
its ears you want its the K40 & if its
power you are going to run then Wilson is it for you!!!!!!!!!!!!!!!! 73s

1415. Open letter to ARRL, FCC

Newsgroup: rec.radio.cb
Date: 2000-01-10 00:00:00 UTC
From: njvets@skyweb.net
Message-ID: <387a2883.342435501@news.skyweb.net>
Source record: 19264
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.cb,rec.radio.scanner,rec.radio.shortwave

As a licensed Radio Amateur for over 36 years, and a long time member
of the ARRL, I offer the following opinion regarding the forthcoming
license restructuring;
Although I am 110% in favor of the CW requirement, I recognize that
it, in itself, is not a measure of a good Amateur Radio operator.
But, there seems to have been an unfortunate trend in the ease by
which a license is obtained. Reducing the CW requirement is another
step in permitting less effort for more privelege. Furthermore, there
is little doubt that the VE examination system is of questionable
integrity. Friends are cut breaks, to outright corruption. Sure,
there are some honorable VE's, perhaps most are. But anyone looking
to obtain a license can get one as easy as getting a parking ticket,
if he just know the right people. To argue this is simply denial of
the facts.
The emphasis seems to be "swell the ranks", not improve the ranks.
Make it easier so we have more, don't care about quality, just
quantity. Sell more radios, perhaps? No doubt, the Big 3
manufacturers are happy with this philosophy.
Anything you get for nothing has no value. Think about it and you
will know this is true. Anything requiring effort and truly earned,
will be honored, respected, and nurtured. Why do we implement policy
that will degrade the value of a license? Why not, just once, make it
something difficult, something earned, something valueable?
I no longer believe that the ARRL is promoting this hobby in a manner
which will cause me to be proud to be a Ham. I do believe, that in a
very short period of time, Ham Radio will become a vast wasteland,
where no one with any intelligence will wish to associate.

Hello!

I am looking for opinions on either of these radios. I've narrowed it down between these two. Plus I like the night controls and weather both has to offer. The Cobra sounds like it may have a few more bells and whistles, but my big concern is recieve. Are they similiar in their recieve? I assume the output is the same. Are their any other advantages of one over the other besides price.

Thanks for any opinions and info.

Lance D.

Mike, take a chill pill. Hams are NOT a progressive, techno-weenie bunch... but don't pay any attention to me, I'm just a new kid licensed at age 16 in 1963 and always amazed at how few other hams ever built or repaired any of their own gear. Hams, as with other humanoids, resent change in any form.When the Novice license was first introduced, even with only a 1-year non renewable license term, it caused howls of protest from many existing hams. In my time, I have seen the Conditional license come and go, the Tech license changed to limited HF (10-meter SSB and Novice HF CW) privileges, Novices extended to 220 phone and 10 Meter SSB and renewable licenses, with similar howls of protest and ads "Selling OUT, Novices and Techs BAH HUMBUG", etc. In reality the dreaded CB'ers have provided more skilled and reliable operators, during the CB heyday of the 1970's, than probably any other source of ham operators. Without them ham radio would have dwindled much more quickly than otherwise. Without the recent (10 or so years ago) influx of new Codeless Tech hams, we olde farts would have almost nobody left to talk to on the radio, storebought or otherwise, by now.
I've read the FCC enforcement lists in QST since first licensed, and the great majority of raging interference, license revocations for profanity, jamming, and other undesirable behavior, come not from new hams but from Advanced and Extra Class licensees. I'm over 50 now and still feel like a kid when attending hamfests and club meetings full of white haired, wheelchair bound, aged hams. My hair is getting ever whiter, and I hope that you go ahead with your interest in ham radio, and that others like you get into ham radio in spite of some of the weirdos you'll run into. All hobbies have loud weirdos, so don't worry too much about ours.

Nice monologue, but you might as well be reciting it to a houseplant,
or sending it via CW to a no-code! :)

You missed the boat. You're too late. Life has passed you by. The
decision has been made, and your letter is in vain. Move on.

And no, I don't care if code is, or is not.

Stop whining about what you _think_ will happen. Most often, it does
not. The ARS needs to concentrate on what it _has_, not what the
individual is pouting for. It like, "Oh, God, I see a change;
therefore, the world is ending." or "Everybody think like me, and join
me in my paranoia."

Grow up, be constructive, OR be part of _The Problem_. It's _your_
choice.

OK, if all of that is true then i don't blame you for the way you feel!
SO if he learned the tricks of the trade, then I would think that X
Force amps are as good as Dave Made, except for the name on the Box, or
the price.
SO what does Dave Made have in a 1 kw base and how much $$?

Right on!
I once had a lot of respect for the hobbt and the amateurs who had
attained amateur extra,no more,for two reasons.
1.I got my own extra in 7 months with no prior code or electronic
knowledge and only a high school ed.IT'S ALREADY TOO EASY!

2.This further dumbing down is just more of the same,politicaly correct
radio,t-ball of the airwaves,nobody loses no matter how little effort
they put in.

At least now my dog can get a license.

> SW2000 except for the stinger. Is this antenna any good???

Its either a Wilson or K40 center load (both look similar). Radio Shack has started carrying several third-party antennas this year (such as the Solarcon A-99).

I have noticed that Radio Shack has been doing this much more often over the last few years. Their shortwave receivers are made by Sangean and Grundig. Their personal cassette sterios are made by Aiwa and Sony. And their home sterio systems are made by RCA, Panasonic, Pioneer, and Sony. In fact, their current catalog is filled with third-party products - either sporting the original name brand or the Radio Shack brand.

What are to advantages and disadvantages of buying the Radio Shack versions? The most obvious is that if you buy the product with the Radio Shack brand on it, you cannot get it worked on by the original maker (Radio Shack does the repairs or sends it out for that). Nor do you get any customer support from the maker (you had better hope Radio Shack has the answers).

Responding to K2TL:
The time for disagreement with restructuring, reduction of CW speed requirements, etc was when the matter was being considered by the FCC, last year. That time is gone now, and it's time for all of us to pull together to make restructuring work for everyone. Sure there's problems in the VEC system, we need to work on that, integrity is essential to maintaining respect, but for every rotten apple there's a hundred good ones, not the other way around. If we know of specific problems, we need to get that information to the proper authorities so action can be taken. Then we need to let them do their jobs.
Instead of tearing the system down and being devisive, we should all now be looking for ways to support the system and make it work. We all had our chance to voice dissent...no doubt you expressed yours as I did mine....but no decision the FCC could have made would have made everyone happy. The decision has now been made, and we should accept it like responsible citizens and get back to work.
No offense, K2TL, but your protest message and dire predictions can only do harm now, and divide us further. This issue has done some damage already to the ham brother/sisterhood in this country, and your help is needed, along with every serious ham, to heal that rift.
"Ham Radio doomed"...??? Only if you and I let it happen, my friend. In each of several instances over the years when there were major changes made, some well-intentioned hams predicted the demise of Ham Radio.... but...it hasn't happened yet. Somehow I think we'll all muddle through this one too. 73, K1MER

MFJ makes one that is as good as any, but you would be better off fixing the radio so you don't have any harmonics going out of band. Don't misconstrue the use and purpose of a band pass filter. It will only clip those signals which are out of the band width of the filter. If you are running illegal power levels, right on the frequency, if it is working properly it will pass on every one of those watts. Beyond that, there are no television signals around 27 MHz. More likely, the television has been overloaded at the front end, and a low pass filter is going to do no good for you. Perhaps a high pass filter on the tv might do some good at attenuating the signal.

> Good bye Ham Radio, it was nice knowing you.
> K2TL

I have a real nice car. It drives like a dream. It's good on gas. It's
really nice-looking, too. I worked hard to get it. It cost me a lot of
hard-earned money. But yesterday my neighbor was given a car just like
mine. So now I guess I have to hate my car. It no longer has any value
to me, because if my friend can get one for "free", and go out and
drive the roads same as me, well that's just not fair. He shouldn't be
allowed to have that car unless he worked just as hard for it as I did
for mine. With him driving the roads, all the fun of it is gone for me.
My car just looks ugly to me now. So long car, guess I'll just walk.

No offense, K2TL, but your reasoning is lost on me. How about taking a
little more positive view? With your years of experience, you can make
a big difference in the way things turn out. You can be a force for
helping the upcoming youngsters be better hams, learn how to do things
the right way, you can be an example and a teacher. You and I have both
been in this game 35+ years...we used to call them "elmers", didn't we?
We don't have to let Ham Radio slip away, let's do something positive.
Let's start by talking positive, not negative. Let's work with the hand
we've been dealt, like we have for all these years, and make it work.

K1MER

1443. Re: To Newcomer Amateurs In Rec.Radio.CB

Newsgroup: rec.radio.cb
Date: 2000-01-10 00:00:00 UTC
From: morrisvillebill@webtv.net
Message-ID: <20794-387A6B94-38@storefull-178.iap.bryant.webtv.net>
Source record: 19292

I was about to learn code and get my amateur license when this change in the code requirement took effect. After reading the hundreds of posts on it in all of the newsgroups (including the CB newsgroup where it doesn't belong), and meeting several Hams recently, I've decided that instead of becoming a licensed Amateur, I'll just concentrate on CB radio. The reason is all of the people like Dwight Stewart.
Although I've come across Amateurs who are genuinely sincere in thier interest in radio as a whole and respect CB radio for its own sake, it seems that more than not are elitist snobs who feel that they are above CBers, simply because they bothered to get a piece of paper saying the government allows them to broadcast on certain frequencies. Yes, anyone can get a CB and start talking, and you do have to go through the exams for Ham radio, but to put one above the other because of this is egotistical and arrogant, and also wrong in a spiritual sense. It seems that old time Amateurs are very angry that the code is being relaxed, because they had to learn so many wpm and now the next group doesn't have to bother. This is also egotistical. Instead of being glad that more people may join the club, they're offended. I can not associate myself with such a crowd. CB radio truly is the voice of the people, the real people, and that is where I want to be.

Date: 2000-01-10 00:00:00 UTC
From: John Thurston <n0meq@mitec.net>
Message-ID: <387a7a92_2@goliath.newsfeeds.com>
Source record: 19297

I have an antenna mounted on a 1998 Buick Park Ave but I can't seem to achieve anything better then a 1.7 on the SWR anywhere within the 27mhz band. I have lengthened and shortend the antenna but can't seem to do any better. I have checked the resistance levels of the coax cable and there are no dead shorts. The antenna mount seems to be grounded ok to the car body. I am utilizing the "firestick" brand of coax with the end that will fit stud mounts.

Any suggestions what I should check next??

Thanks

Your short time is here.

Welcome to ham radio-set your watch back 40 years

Please visit my World Wide Web Site, you have never seen a page like it.
You will see:

1. How to pass the A+ Certification
2. Really interesting answering machine messages
3. A blond naked chic being held by a female ham!.
4. How you know you are a ham.
5. Hear Ted Kennedy really screw up in front of Clinton
6. Actually sounds of Bill Clinton "after the lov'in".
7. The writings of me and others on ham radio, hear a typical ham contact.
8. The warm side of K1OIK, hear me speak, see me with famous people.
9. An amazing card game that will shock others
10. Pictures of me and my family.
11. Did common German's enable the holocaust?
12. See now the future of ham radio.

1451. FS: Sperry Systems CB Converter

Newsgroup: rec.radio.cb
Date: 2000-01-10 00:00:00 UTC
From: Jerry Straight <jerrys@xuser.com>
Message-ID: <3879d5a6.0@news.xetron.com>
Source record: 19300

Hi,

I picked up an old AM/CB converter the other day. It's a Sperry Systems, Inc. "CONVOY 500" with 23 channels. It is packed in a cardboard can and was sold originally in SuperX Drug Stores probably in the 70's or early 80's.
Has cig lighter and antenna cords for hookup and OFF/CB switch on front. Size - 4"W x 1.5"H x 2.5"D. Looks mint like it was never used. Can package is in good shape and label shows picture of unit on front, warranty on side and "CB 10" Code table on side of can. Offers 10-4?

Thanks,
Jerry

You didn't take away anything, but the FCC sure did!

It's typical for those who dislike working for something and who
expect handouts to not understand why some people have pride in what
they accomplished.

With that in mind, I understand why you agree with the suggestion
people just forge documents that are symbols of what they accomplished
in life.

But I think picking on a guy who is proud he worked for something is a
sign of just how bad our society is getting. Socialism at it's finest!

1.Poor, or no chassis ground on the antenna mount.
2.Broken, pinched or kinked coax.
3.Antenna has not been tuned on vehicle.
4.Loose or corroded connections.
5.Short or open connections.
6.Antenna tuned without tip, and then tip installed.
7.Antenna tuned with tip installed and then removed.
8.SWR checked with door open.
9.Excess cable wound into small coil...creates a "choke" effect.
10.Improper cable length. If in doubt, use 18 ft.

Dont trim the coax, the problem is most likely the antenna, is it mounted on the trunk? if so you could be getting some reflection off of the back window. If it is mounted on the roof you might be lacking in counterpoise. This could be the problem on the trunk as well. Try a whip on the mount temporarily to see if the match improves. Try some different antennas, you might be surprised.

Hello everyone on the board. I have a cobra 25 sticking in transmit after unkey. The problem arises after high modulation. If I talk soft or normal voice it works fine but if I talk loud into the mike then unkey the signal meter will peg to 30db with nothing but noise level and no receive. I have done some power mods to it and I have variable power as well hooked up to rf gain control knob. What component switches from receive to transmit if any? This may be my problem. Thanks all

Jumpy

I am in the market for an inside window mount (stick-on type) antenna
for use on a train window since thwy won't let me place on on the
outside of their train.

I once saw a dual band (144-440) flex one made by a german company but
am not able to find it in any outlet (HRO etc.).

Any information would be appreciated.

So what? Are you interested in collecting licenses, or are you interested in radio? If you're interested in radio, then your license is just as valuable as your radio skills, no more and no less. If you're interested in licenses, then, I dunno, take-up fishing. You can get a license from every state!

> Once upon a time, a ham license looked good of a job application or

Here's my angle: I am looking at the person, not the paper. I guess that I'm too old-fashioned, eh?

> And it is still true that the value something has, to its owner, is
> directly proportional to how much effort one had to expend to get it.

Congratulations! You have identified the problem: The man is obsessing on "getting it". Getting what? A piece of PAPER. Forget the piece of paper. What matters is the knowledge, the experience, the fun. Paper is made from dead wood.

Yeah but the true way to fix the problem is to find the problem first. Try the different antennas, if an antenna is loaded and the load is below the roof of a vehicle the problem could be that the load is radiating directly into the back window. An antenna with a load above the roofline will tell all. Adding a 1/2 wavelength of coax tends to skew readings at the radio. Sometimes the antenna sees the shield of the coax as a counterpoise.

18 Feet is the best length because it is 1/2 the wavelength
of 11 meters. some times you can get away with multiples of
9 feet, But when it comes to a mobile install there are a
lot of weird thing to overcome.

All the answers here tonight I have come across. The ground
plane what your antenna sees may not be what you expect.

Cheers,
John

Licenses are not degrees. They are no more than permits. Thier value
should be nominal. You should evaluate an individual ham by his/her
actions, not by his/her license. Besides, one doesn't really need to be
a "tech whiz" to be on air. But for those that are "tech whiz's", well
congratulations. If "tech whiz's" are looking for paper recognition
(which is silly in my view), then perhaps a note or something could be
atached to his/her license -- however, there is no need for assigning
radio permissions based on this.

> It's no different than the bogus network "certification", that

> Dave

Regardless of how long it takes to study for the ham exam, the exam should nonetheless be relevant to the requirements of operating ham radio. That is, while the exam should take into consideration requirements, it should not place too much emphasis on those things that are merely desirable.

Your statement "Anyone whose license permits the use of CW...." is very misleading. All licences permit the use of Morse code. The Morse code test is not about whether the operator is allowed to use Morse code or not, but whether the operator is allowed to use bands below 30Mhz. Passing a Morse code test is not necessary for an operator to legally use Morse code on the appropriate Amateur bands.

Dave Heil wrote:

Try Shortening your coax by 1/4" increments to see if that will
correct the swr. Dont trim too much off!!! In most cases, your left
over coax (coiled up due to too much length) will cause high swr. Try
to not coil the coax but lay it out so that it isnt bunched up!!

Source record: 19341

When I used to have one, Mine was slightly modified and did avg. of
900 watts 1100 peak watts. A new one out of the box will avg 600 watts
give or take 50 watts. I would like to say it was my favorite linear
of all and be carefull of heating up cuz the fuse holders will melt!!

I too have my Extra ticket. I am not too worried, the foul mouthed individuals who are on 11 meters or 3950 don't use CW that often. I use CW almost exclusively. As I see it, the AMers an SSBers and FMers will have to bare the brunt of a new class of lids. 20 CW will be safe foever,

Just so some of you know, I utilize both CB and HAM bands legaly and yes there are some snobs on the ham bands. I dont associate with the egotistical snobs so to speak! I associate with the more relaxed hams and we talk about the same kind of stuff there as we do on CB without the profanity creeping in! However it is known that there are a few "Rebel" repeaters out on the ham bands that allow just about anything to be said! One for instance is the once known N6UUM repeater on 224.160 in the San Jose, CA. area and the (Not assoc. With the N6UUM) 147.975/440.475 repeaters in Hayward, CA. These repeaters were very well known for real in depth put downs and the continuing rebelion against a known jammer (K6CBL). Somewhat like cb but with a real smart group of guys and gals that were mearly just having fun at there own expense! So dont allow a few snobby old men run ya off. Ham radio has a place for all if you intend to study and make it the best!! Just dont expect to get a ham radio and talk like a cb'er.

73's and hope ya try for yer ticket!!

Hi Bill ...

Just some speculation here... haven't done this myself... quite
a few little mods to be really useful on CW...

You could inject a tone from a *stable*, *clean* audio with a very
pure sine-wave oscillator into the audio input. While theoretically
OK, you *really, really* should check your output with a spectrum
analyzer if you're using this method. If you don't have a clean input
(or some RF climbs back in) you'll have a wide, 'dirty' signal very
much frowned upon in the CW band.

Alternatively for true CW you'll have to use FM mode for transmit -
with a null audio input via resistor across mic input - and with
the key connected to the mic switch. You'll have to hustle back'n'
forth to USB/LSB mode for receive. Some added logic switches would
help here to rapidly move the board btwn FM & a sideband mode.
Again good shielding on anything connected to the mic jack is
important here (we don't want any RF climbing back in, and we
don't want any noise of any kind getting into the mic circuitry
to FM a CW signal!

You should also be aware that the 'clarifier' control is essentially
a 'tied-together' combined RIT+XIT control that is not separable.
A dual-control pot with some xmit/rcv switching logic could be added,
and this should've been done IMHO.

Although sensitive, the receiver on the HTX10 is pretty broad. An
audio CW filter will certainly help but better (narrower, more poles)
xtal IF filtering would really be necessary to make this into a
good CW receiver - along with far narrower tuning steps.

Methinks a Uniden HR2510/HR2600/President Lincoln or older Radio
Shack HTX100 rig would be a bit bitter, and not require any (or
much) surgery.

73 N6AOT

If it does turn out to be your coax, try using a length of 18'. Some people might laugh, and say that as long as your running the coax in lengths that are divisible by three feet that everything will be alright, but I've had problems, similar to yours, and by changing the length and aslo making sure that the coax was not bunched up, helped solve the SWR problem

There was a little girl and her mother walking through the park one day and they saw two teenagers having sex on a bench. The little girl says "Mommy what are they doing?" The mother hesitates then quickly replies "Ummm..... they are making cakes." The next day they are at a zoo and the little girl sees two monkeys having sex. Again she asks her mother "what are they are doing," and her mother replies with the same response, "making cakes." The next day the girl says to her mother "Mommy, you and Daddy were making cakes in the living room last night, eh?" Shocked, the Mother says, "How do you know?" wait for it.............

wait for it.............

Are you prepared for this???????

here it goes............

She says, "Because I licked the icing off the sofa."

What type of antenna is it?
Firestick??
They have tunable tips. Or unwind the coil of wire at the top and cut off half an inch. If SWR goes up , you ned to lengthen it. Solder some wire to it.

Tell that to the military, who still require CW capabilities in their
portable radios (at least some of them). I have not talked to anyone
who has gone through the radioman schooling recently, but I suspect
that they require that all radio operators at least learn the code.

It does have uses - even if your radio is an FM rig. Simple keying
of the carrier produces a CW signal - better than nothing if the
microphone or modulation circuitry dies.

Uh, Dave. CW is allowed on ALL HF frequencies. It is the only mode
where this is true. There are just certain band segments that are
set aside for CW only.

While you may have a good connection between the trunk lid and the antenna mount, the connection between the trunk lid and the body of the car may leave something to desire (and not much of a "ground plane") Try putting a wire jumper between the trunk lid and the car's body... just use sheet metal screws and crimp-on spade connectors. Is this a top loaded antenna?... if so you want to be sure that as you push the whip into the fiberglass portion of the antenna to shorten it, that you don't wind up with the whip's other end extending into the wire coil formed on the fiberglass portion of the whip...detuning the antenna.

FM is NOT used because of "capture effect"... the tendency of a receiver to hear ONLY the strongest signal. AM does not exhibit this effect... although a much more powerful AM station can drown out a weaker one, in most cases it's still possible to detect the weaker station. Important for aircraft safety.

In rec.radio.cb Dave Hall <nojunkmail_n3cvj@worldlynx.net> wrote:

: It's no different than the bogus network "certification", that
: Mickey-soft and Novell started for computer professionals. It's a piece
: of paper, that says that you know something. The difference is that MS
: and Novell are making big bucks off of everyone that studies and takes
: the test. But it's only worth something if you recognize the validity of
: the testing methodology.

Funny. I just received e-mail from MS today - offering their Certified
Network Engineer (or whatever it is) class. The cost is $8000, but they
pay me $10,000 when the class is completed.

: Maybe we just want to make sure that everyone who plies the ham
: frequencies has enough technical knowlege to keep them out of trouble,
: and enough responsibility and maturity, that they won't cause trouble.

The knowledge requirement went away as soon as they started publishing
the question pools. It then became a matter of memorization.

Nothing in the Amateur testing has ever guaranteed that the person would
be either mature or responsible - or that they wouldn't cause trouble.

: And it is still true that the value something has, to its owner, is
: directly proportional to how much effort one had to expend to get it. If
: you had to apply yourself for the better part of 3 or 4 months preparing
: for, and passing the test for a ham license, you will be less likely to
: abuse the privilege, than someone who just signed on the dotted line.
: That's human nature.

Maybe. Or maybe someone who had to work hard would ignore legal
requirements when he/she though it possible to get away with it,
as a "right" for having to work so hard.

I don't know why the old Extra holders are so upset about the new rules.
It does not degrade THEIR efforts, or lessen the value of their licenses.

Remember when you had to hold a license for 10-20 years (I forget how long)
before you were eligible to apply for an Extra Class license?

Personally, I feel that the publishing of the question pool is wrong, but
it is only my opinion. I believe a person should have practical knowledge,
not just a bunch of memorized information.

On the other hand, I have more respect for the recent no-code tech who
behaves himself on 2 meters, and maybe plays with packet radio a bit, than

I do for the notorious groups of troublemakers on 75 meters and elsewhere.

Yeah Right <yeahright@dopefish.com> wrote:
: Try Shortening your coax by 1/4" increments to see if that will
: correct the swr. Dont trim too much off!!! In most cases, your left
: over coax (coiled up due to too much length) will cause high swr. Try
: to not coil the coax but lay it out so that it isnt bunched up!!

Shortening the coax will NOT solve any SWR problem. The best it can
do is mask it.

And, far from causing a problem, a coil of coax may actually be an
improvement. It cannot cause the SWR to increase. What it can do
is reduce any rf currents on the outside of the coax.

Such "coax baluns" (misnamed) are very commonly used to match an
unbalanced feedline to a balanced antenna. But it will function
the same way for an unbalanced load.

If the SWR cannot be reduced to 1.1:1 by adjusting the antenna, then
there is something wrong with the antenna (assuming that the coax and
connectors are OK - not always a good assumption). It could be where
the antenna is mounted, improper grounding, corroded connectors, water
in the coax, pinched coax etc.

: 4.Loose or corroded connections.
: 5.Short or open connections.
: 6.Antenna tuned without tip, and then tip installed.
: 7.Antenna tuned with tip installed and then removed.
: 8.SWR checked with door open.
: 9.Excess cable wound into small coil...creates a "choke" effect.
: 10.Improper cable length. If in doubt, use 18 ft.

All the above are good - except for 9. The "choke" effect is
often desireable. It only affects RF currents on the outside of
the coax - it does not affect the RF inside the coax.

You can add, defective antenna to the list - as well as placement
of the antenna on the vehicle.

Brush up on your 10-codes Boys.

The CB-RL, Citizens Band-Relay League in Newington, CT, is
going to update their Operating Manual with a section on 10-codes
and CB Lingo so old Hams can understand what the new hams
are talking about. There's also going to be a section on how to
properly tune a transmitter for maximum over modulation & Splatter.

Quote of the Day:
The FCC served me a shit sandwich... but I can't see any bread.

1st you say the VE system is corrupt then that perhaps most VE's are honorable...Which is it? VE's risk their own license every time they sign for someone else's.... I have yet to meet a VE (and I've known a hundred or more) who would risk their own Extra Class ticket to "hand out" a license. Using your logic of painting the entire VE sytem black because of a few improprieties, then perhaps all "Coded" hams are like those fella's on 14313kc, 3950kc.... I suppose you'd throw out a cart of apples cuz' you find one bad one!

>I no longer believe that the ARRL is promoting this hobby in a manner

Then renounce your membership.... then go see if you can find anyone else who's fighting for your interests.... K1MAN? ...73 Magazine? ...Gordon West? ...W5YI? ICOM? ...Yaesu? ...Kenwood?
...CQ???.....Whooooooooooooooooooooooo???

> I do believe, that in a
>very short period of time, Ham Radio will become a vast wasteland,
>where no one with any intelligence will wish to associate.

I believe we heard all this before, at the introduction of the No-Code Tech license. It has not come to pass. Tell me.... what exams did you take? ...Did your first license require a CW exam? Did you take one of the easier exams under the VE system (where you had access to all the answers), or one at the FCC field office??... Did you have to prove you could send good code as well as recieve it? ...Did you have to upgrade your Novice license in 1 year or lose it?

My point is... times change, licenses change, requirements change.... LIFE is change.............. adapt to life as it IS and WILL be or fade away like a dinosaur.

Well said! I always get a kick out of those who come crawling out of their shacks after the shit's hit the fan and wanna' know where the stink's coming from. To bad more don't get involved with their "beloved" hobby when it needs them and wouldn't spend a 32 cent stamp to write the FCC when it mattered...

Seems most hams think "putting your money where your mouth is" means buying a better microphone. You know what they say about the advent of 30 gauge wire..... it was first made when two hams found a penny on the floor at their radio club meeting.

That's NOT correct. I have seen TONS of instances that un-winding the coax
has corrected a problem and helped the radio to load up correctly.

This is not to mention that coax that is wound up tightly can suffer from
impedance bumps. This is especially true if running foam type cable and
pretty good sized amps.

For best results, spread the coax out as much as possible and DO NOT coil it
or spiral wrap it around a metal object. Sean

jke <jke@advnet.net> wrote:
: 1.Poor, or no chassis ground on the antenna mount.
: 2.Broken, pinched or kinked coax.
: 3.Antenna has not been tuned on vehicle.
: 4.Loose or corroded connections.
: 5.Short or open connections.
: 6.Antenna tuned without tip, and then tip installed.
: 7.Antenna tuned with tip installed and then removed.
: 8.SWR checked with door open.
: 9.Excess cable wound into small coil...creates a "choke" effect.
: 10.Improper cable length. If in doubt, use 18 ft.

All the above are good - except for 9. The "choke" effect is
often desireable. It only affects RF currents on the outside of
the coax - it does not affect the RF inside the coax.

You can add, defective antenna to the list - as well as placement
of the antenna on the vehicle.

Amateur Restructuring, Liberal Democrats, and No-Coders.

The FCC's restructuring plan shouldn't be a surprise to
anyone. After all, it comes out of the Liberal Clinton
Administration. Conservative republicans are willing to work hard
for their rewards, but Liberal democrat No-Code CB whiners want
everything handed to them on a silver platter. The democrat
whiners want to get ham licenses as easy as they get their welfare
checks. And the Liberal FCC, part of the Liberal Clinton
Administration gave the Liberal No-Code CB whiners what they
wanted, and the rest of us got shafted. Liberal Democrats like
to steal treasures from the hard workers, and give to those who spend most
of their time waiting for another government hand-out. When liberals do
this, it makes them feel important & needed.

restructured Ham = Welfare Ham.

I graduated as the Distinguished Honor Graduate from the Army Signal School at Fort Gordon, Georgia in my Telecommunications field in 1987. Code was out then. In 2000 it's probably taught in History class! For the many high speed mutually independent telecommunications systems of the modern battlefield CW has no role.

It is not a question of whether the code is or is not worth anything. It has not been worth anything since 1945. Rather, it's a question of a bunch of guys who had to do something to get their license and now you don't have to do this anymore so they are schooling together like guppies to asert that their "higher" learning is the best and everyone else is "inferior". What a joke! No one buys their song and dance for a minute and neither did the FCC. The question is when are these people going to admit that things have changed and their "educations" are obsolete. It is hard on a person when they come to the realization that they have passed into obsolescence so hearing them strike out in utter frustration should not be a surprise.

Amateur Restructuring is not a simple, one-sided issue, although many would like to force the many different viewpoints into one small box.

Times are changing, and whether we like it or not, there are realities that have to be faced. Here are a few.

The "magic" of your voice (or code) traveling thousands of miles is basically gone. I'm old enough to remember well the first color televisions, trans-Alantic TV signals, etc. When I first experienced amateur radio (as an early teenager), it was beyond belief that you could actuall talk to someone long distance wireless. I was even awestruck at some cheap walkie-talkies I owned! Now, we communicate effortlessly worldwide via the internet, instantly.

Commercial interests want more bandspace, and amateur radio operators who are time-frozen in the past have a poor argument to occupy valuable spectrum space to discuss their gall bladder surgery, latest bowel movement, etc., simply because they grunted it out years ago to meet the requirments of 13 wpm, and so on. Amateur radio was intended from the start to focus on public service and to encourage growth (in electronic knowledge). It was never intended to be a static, backward-looking social club, remembering the "good ole days". The very nature of amateur radio points forward.

The technical aspects of amateur radio have changed incredibly. Twenty years ago, you could still work on your own car (plugs, oil change, tune-up). Check out the lastest cars, and tell me how much you understand. The people I first met in amateur radio built their own rigs (early 60's). Today, that same rig would splatter unacceptably all over the band. Then, most built their own. Today, probably 98% use quality, name brand, sophisticated rigs, with tight specs on both transmit and receive. It's a changing world.

YES, some things could get better. Getting rid of the corruption in the VE program would help. Riley Hollingsworth has been extremely good news for the hobby. But perhaps we should require computer aptitude tests as part of the hobby (to weed out the old farts). Maybe we should ban discussions of all personal health problems, not to mention useless nets, that accomplish little. Simply passing the CW and written test back then is not a lifelong license to sit back, and reap the "reqards" forever in careless, meaningless blabber. I have always been in favor of amateur radio operators having to provide "evidence" for their continued re-licensing, such as proof of public service, classes taught, projects involved with, etc, much as medical

professionals have continuing education to keep them sharp. One statement the FCC made in their R&O was that there was basically no correlation between those who learned CW, and those who were proper station operators, or were significantly involved in public service. I couldn't agree more. What right does a 30-40 year Ham veteran have to needlessly blab on, using maximum power (or more), with poor antenna matching, and generally abusing the spectrum. Yet, that person is exactly the same person who will argue themselves blue in the face about the need to keep the code, etc. They need a reality check.

There is plenty to compliment and plenty to criticize in amateur radio today. I compliment the FCC for having the guts and sense of REALITY to not only face the real facts of the day, but to do so in a way that doesn't necessarily favor any special group, including the ARRL. Hopefully the tests, method of testing, band usage, etc. of today's amateur service will improve, and retaining CW at previous rates was not solving the problem. Kudos to the FCC for being willing to move forward with guts rather than look backward with failing memory.

I'm in my 50's, and hopefulle young enough to still engage and enjoy the new realities and technologies that emerge each day. However, the "tomorrows" are owned by the young, and I hope I have enough sense and graciousness to know when to get out of the way. The FCC has taken an important first step. I hope during the year 2000 that they and the amateur community can find some good solutions to the problems we still face and better use of the privileges we enjoy.

AB7RS, you seem to be missing the fundamental point of the license exam. The license exam is not a final exam to proves skills or knowledge, it is an entance exam into the hobby of amateur radio.

You're not supposed to know everything when you pass that exam (for any license class). You learn about the various aspects of radio after getting the license.

And, with that goal in mind, the current license exam system is just fine - it does exactly what it was designed to do.

Wrong, Bill. After reading a discussion about this in another newsgroup, I checked with the public affairs offices of the radio training schools for each service branch. None of them were aware of any CW training still going on in the military.

One guy in an amateur radio newsgroup recently claimed that some special forces personnel receive this training, but both the Army and Marine special forces training centers say this is simply not true (they use high-speed burst communications through satelites for special forces communications).

CW has been dead in the military for a long time. I didn't learn it at the Army's Signal School at Ft. Gordon in the early 70's (MOS 31M). The Air Force seems to have dropped it even before that. The Marine public affairs officer was not sure when they dropped it. However, of the ones we know, the Navy seems to be the last one to have dropped it from all training programs about eight or nine years ago.

If you don't believe me, Bill, check it out for yourself. This is not classified information and I found each service branch to be very helpful and open about the subject.

Gee, William, are you the "radio designer" in rec.radio.cb that he was talking about? William, are you going to sit there and tell me that you took that message seriously? Even the original writer didn't take it seriously - he would not have made such absurd statements if he did.

And now you're saying that you're going to stay away from ham radio simply because of what I said in my message. Well, if that is true, you're a darn fool, William. My message is not a statement about ham radio. And I don't represent ham radio. I'm just one person posting a silly message in response to a silly message in an internet newsgroup. If you let anything I say, or anyone else says, in this newsgroup, or any other newsgroup, affect the direction of your life, then you're a complete idiot.

Wake up, William. This is an internet newsgroup. There are serious messages posted here. There are silly messages posted here. And there are absolutely stupid messages posted here. Take each message for what it is - nothing more.

And you cannot know anything about a person by reading a few messages posted in these newsgroups. You could read a hundred of my messages and know very little about about my real life at home or on the radio - just like I know very little about you after reading your message. The same is true for all the other people posting messages in these newsgroups.

Now, as far as your effort to group me with all those other hams you don't like (even though you probably know as little about them as you do about me), you can kiss my rear end. I'm not on this world to please you, William. So I don't really care about your prejudicial opinions.

Now, if you want to get a ham license, William, then get it. Don't do it because of something I said, and don't NOT do it because of something I said. Get it, or don't get it, because of yourself - its your ham license (or it will be). Nothing I, or anyone else, says or does should have anything to do with it.

You can take all that advice seriously if you want. Good day, William.

> station. Important for aircraft safety.

Another reason is the massive effort it would take to switch all aircraft and airports world-wide over to another mode at any given moment. All aircraft world-wide would have to be grounded to switch out the existing radio equipment with new equipment. And, at that same time, all airports would have to switch radio equipment also. Then everything (aircraft and airports) would have to be tested to insure they will operate correctly before any aircraft could be allowed to fly again.

All of this could bring air travel to a stand-still for several days - leaving many passengers stranded wherever they are.

Some have suggested a more phased-in approach. However, many feel this would only add to the already confusing nature of world-wide air operations (pilots who speak other languages, etc). With that in mind, most agree that this is simply too risky.

So, for lack of an easy way to change it, the existing system remains the standard.

Well, John, I bet you didn't expect this many responses. I'm going to go with the mounting location as a possible cause of the problem. If you're mounting it on the trunk, that reading may be all you can get from this antenna. Mounting location can affect each antenna design differently - some antennas are more problem prone while others are not affected at all.

Are you sure you're getting a good ground with the mount? You need good metal to metal contact for this to work - the paint on top of the metal can prevent a good electrical connection.

Of course, make sure your door is closed, and your vehicle is away from any metal object, when taking these readings. This can affect the readings.

However slight, another possible problem is water in the coax. Are any of the ends or connections exposed where water can creep in? If so, install new coax and make sure to seal any exposed joints.

And, like others have said, I would also not recommend that you trim your coax. While this may appear to make the SWR go down, all you are doing is tuning your coax to act like an antenna (and coax makes a very poor antenna).

Everyone should get back to the real world.

The only thing to come out of all of this will be a sudden surge to "higher class tickets" (that won't really be the same techinal standards as higher class tickets from the past) and more phone band congestion.

There won't be any massive influx of new hams, and the hobby won't suddenly "turn around" and grow.

Testing never stopped the large majority of people from upgrading. It was only the people who lack memorization skills or enough motivation to spend a few hours a week memorizing the test who failed to upgrade.

The lowering of standards has never "pumped new life" into anything.

It'll make lazy people happy, and Kenwood will sell a few radios. Then in a few months it'll all die off and many people will start crowing "why don't we reduce requirements even more?".

If you doubt this, look at CB. CB fizzled desipite essentially being a "free band" with no enforcement and no license required. The only thing that was gained were manufacturers made money selling radios, and the low end of ten meters and proper users of frequencies in and around the 11 meter band were ruined in the process.

Vince,

Being a Republican with a strong Libertarian streak, I must ask, just what does Morse code have to do with radio? I mean, telegraphy(sp?) originated on wires are you using it to communicate these long diatribes?

I certainly hope you have done something to further the art of radio communication than manually operating a spst momentary switch and acting as a bio-modem.

Morse code can be fun, and I am personally pushing for my 13 WPM, maybe even 20, but it is for fun. Logically, it has zero to do with the theory, operating practice, or development of Amateur radio.

Please stop crossposting these posts to the sat group. I know not much goes on here, but this condescending saber rattling is NOT on subject.

Thanks

Christopher Cox
KC8FRJ

PS look at the bright side, this initially should have little impact on the A1 band allocations, and possible band crowding may spur more op.'s to use CW as a communication method.

When the nocode-Tech was introduced the amount of hams operators increased dramatically. Infact nocodes became the largest of the licensed groups.. and from that many nocodes became Generals needing to learn Morse code "WHY?" They wanted to be better than they were. Either for one of two reasons. "the bragging rights" or "self worth". I see the same thing happening to the new requirements, and that will be the drive for most hams in the future to become a code ham. This will also increase the Ham population. In either way allot of Code sent today is by a Auto keyer or computer. Most of the Hams I know that are General or above don't even remember the code they needed to learn to get the license. They just wanted it to talk on things like 10 meters. So I look at it like this. In the long run this is going to create MORE hams to help fight off the communication giants of the world who wish to take our freq. for there gain. WE HAMS ARE STRONGER IN NUMBERS!

And that is what I was refering to. If CW usages declines appreciably,
the justification for special band segments for CW will diminish as
well.

Frank, no-nonsense comments that are pretty much on the mark.
Unfortunately, while those of us who already see the light, will agree
with you, those that refuse to accept another perspective, will argue
their dogma until the ground reclaims them. What's that about teaching
an old dog new tricks?

Like the old saying, "try to tell a nut that he's nuts, and he'll swear
that you're crazy".

Dave

Then why to people go to college to get a degree? That "piece of paper",
like a ham license, is a symbol of what you've endured in order to EARN
the privilege of being what you are.

I know sveral "computer whiz" guys, that are 100% self taught. They
attack thier hobby, with intense enthusiasm, and are probably as smart,
if not smarter, than "book taught" college guys. But you know what? when
it comes to finding a high level computer job, they have it tough
because they lack the PROOF (the piece of paper) that says that they
really know what they are doing.

> I'm too old-fashioned, eh?

You cannot ascertain, with any certainty, the level of qualification a person has, through a simple personal interview. Remember, you might LIKE the person, but the fact that he shot a 65 on the last 18 holes, drives the same kind of car, and has a hot looking girlfriend, mean nothing as far as far as job qualification goes. Any documentation, licenses, degrees, etc, that someone has is a testament, to their skill level. A ham radio license used to be highly regarded in that vein. Today, that is not as true.

>
> > And it is still true that the value something has, to its owner, is

The "piece of paper" is only a symbol. It's what it stands for that's important. A ham radio license is only the starting point. Hopefully, a person will learn more after being licensed. But for many, the achievement of the license, is acknowlegement that they've reached a milestone in their goals. Life is but a series of goals. Why diminish the value of someone's goals?

> should be nominal.

The license is basically a permit, but it is also the permit to operate some potentially dangerous equipment. Equipment that can cause harm in some cases, and interference in others, if not operated properly. By passing the "permit" exam, you are basically providing proof that you know enough (in theory) to stay out of trouble. If for no other reason, that is what makes licensing necessary.

Why do we license drivers (Other than the cynical answer "to fund the governement via fees")? Would you feel safe on the road, if you were aware that people did not have to pass some minimum skill and safety testing before being allowed out there with you?

> You should evaluate an individual ham by his/her actions, not by his/her license.

True. But that still does not diminish the value of the license as a certification.

> Besides, one doesn't really need to be a "tech whiz" to be on air.

Ask any CBer and he'll agree with you. But is that what we want for ham radio?

> But for those that are "tech whiz's", well congratulations. If "tech whiz's"
> are looking for paper recognition (which is silly in my view), then perhaps a
> note or something could be attached to his/her license -- however, there is no
> need for assigning radio permissions based on this.

There certainly IS. I'm sorry, but you can't tell me that a person should be given the responsibility to run a 1.5 KW station, with variable frequency control, with the potential to cause harmful interference, harmful radiation, and the potential for self injury if used improperly, without some form of testing first? That's insane! The more you know (and can demonstrate) the more privileges you should have.

If you just want to yack with your "bro's", then use the internet,
phone, or stick with low power radio services. That way you can't hurt
yourself or anyone else.

It's an analogy. You drew the wrong parallel. This has nothing to do
with who's getting paid for what. It's about the recognition of
certification, and the value that it projects.

>
> > Once upon a time, a ham license looked good of a job application or

No arguement there. But the line between "required" and "desirable" can be subjective. What's required to you, may not be for another person. That's why we have the FCC, who hopefully has the foresight to make that decision in an unbiased manner.

Dave

I didn't say that the current testing was perfect. I agree that you
should be required to LEARN the materrial, rather than simply memorizing
Q&A's.

> Nothing in the Amateur testing has ever guaranteed that the person would
> be either mature or responsible - or that they wouldn't cause trouble.

Nothing in the driver's license exam guarantees that either. But
hopefully, it DOES show that they've achieved the very basic minimums,
and hope that the person has some common sense as well.

That is certainly one distroted way that some people view life. Some
people think that they have more "rights" than they are entitled to.
This sort of "spoiled thinking" is based on, IMHO, having never been
taught the meaning of the word "NO" as a child.

>

Also agree! Many old timers put down the no-coders, under the
mis-informed, preconceived, sterotypical, notion, that no-coders are
nothing more than CBers. I don't think they will even get it through
their thick skulls, that there are some really talented communications
guru's in the making on VHF/UHF thanks to the no-code license. THEY will
be the ones that finally bring ham radio into the digital age, not the
old time CW ops, still passing traffic (and wind) the old fashioned way.
In the time it takes them to copy one piece of traffic, a modern digital
network can send a hundred times that amount across the entire globe and
back.

youve made lots of very serious absurd statesments since youve been here on rec.cb.radio. remember the no skip on 11 fiasco?

> William, are you going to sit there and tell me that you
>took that message seriously? Even the original writer didn't take it
>seriously - he would not have made such absurd statements if he did.

> And now you're saying that you're going to stay away from ham radio
>simply because of what I said in my message. Well, if that is true,
>you're a darn fool, William.

not what you said, just the way you and all the other 2 meter radio rambos act towards the general non ham public.

>There are silly messages posted here. And there
>are absolutely stupid messages posted here. Take each message for what

youve showed that time and again.

> You could read a hundred of my messages and
>know very little about about my real life at home or on the radio

about 9 years as a entry level no code ham. not very impressive.

> Now, if you want to get a ham license, William, then get it. Don't do
>it because of something I said, and don't NOT do it because of something
>I said.

hope fully i'll hear william in the extra portion of 80 meters later this year. i will be one of the newest amatuer extras out there. ive been playaing with about 10 wpm on 11 meters for the last couple years so 5wpm is a piece of cake. now if i can just wire my echo master plus to the kenwood. ;)

73 and best wishes.

Well, look at the bright side, Dick. The advanced class ticket
will become the *PREMIER* ticket in ham radio because it required
13wpm code, not a measly 5wpm like an extra ticket. :-)

Hi Jumpy,
It sounds like either your S/RF meter has the needle sticking when you slam in with high modulation or like your suspecting the unit is actually staying in the xmit mode when you unkey. Assuming you have low swr on your antenna system, you will probably need professional help to fix it. However, for a sticky S/RF meter needle just turn down the transmit meter sensitivity to prevent the needle from slamming.

Very true, the equipment uncle sam trained me to repair was a voice to digital converter, digital encryption system that had been developed in the late 50's, and was nearly obsolete in the early 70's. Although it was still Top Secret Crypto rated, they had much better equipment out that we were also trained on--and the big problem that all the "old" guys complained about was how much more bandwidth was required for the "new" equipment. But it sure sounded great!

Bill,

Blow it off. Do what YOU want to do, not what someone else makes
you feel you should do.

Hey, HAM and CB are just reflections of the real world, and there are
idiots and '*' everywhere. If you have fun with CB, and that's enough,
fine. But if you also want to be a HAM, that's also fine, just do it.

And remember, regardless of some of the 'real loud' people, the
majority of the comments with the FCC, and the ARRL for that
matter, SUPPORTED the changes to the rules. And don't let yourself
fall into the trap of assuming it's the old HAMs vs the new HAMs.
Just remember that the first push for novice enhancement was from
the QCWA (I hope I got that right, the Quarter Century Wireless
Association, if I have it right.) The very 'old farts' who recognized
that the hobby needed changing. Everybody else fell on board later.

Yeah, there are the 'old experts' that are loud, but that's just because
they are insecure with the changes. Most will eventually come around.
Not because of it being good or bad, but just because it's the way
things will be and they'll eventually tote the line. Just watch out for
other 'newbies' that are brainless and fall into the trap of spouting
what they perceive as the 'old authorities' to make themselves look
and sound important. You'll quickly spot them for who they are. And
recognize their brainlessness for what it is, as that won't go away
with time for most of them.

I differ in that I do not believe that there is something "wrong" with and antenna that can not be tuned to a 1.1:1 VSWR, many antennas are not even designed to achieve that. My 102" whip mounted in the center of my old beater Radio Car had approximately a 1.2 to 1.3 to 1 and that was considered exceptional. The only antenna I have used that, right out of the box, had a 1.1:1 was a Starduster base antenna. It is one of the things that really impressed me at the time, as my meter and anyone else's that I could talk into coming over with theirs moved so little, that we thought something was wrong!

>Welcome to ham radio-set your watch back 40 years

Your main web page includes a link labeled "The Future Of Ham Radio"
which, when clicked, leads to a page titled "Code Forever" - if the
statement about setting your watch back 40 years is true, guys like
you are a major reason why.

>Please visit my World Wide Web Site, you have never seen a page like it.

I did visit. I have never seen a page like it. I hope to never see one
like it again:

>4. How you know you are a ham.

Sample items from the above: When you find yourself mentally
undressing your rig....when you'd rather turn on your rig than turn on
your wife.

Also shows a cartoon with a woman in bed with a man on one side of her
and a pig on the other, the woman is saying "I'm surrounded by hams!"

>7. The writings of me and others on ham radio, hear a typical ham contact.

The writings of K1OIK on ham radio consists of a scan of a page from
Radio World Magazine on which the magazine printed a letter in which
K1OIK disparaged ham radio by making such statements as this:

"Hams are required to serve the public, but in fact they are serving
themselves. Worse, they cause interference to other services (like
your TV) and they erect large towers and guess what, there is nothing
you can do about it."

The brilliant K1OIK also asserts, "Cell phones have replaced the need
for most emergency ham communications in this country."

>12. See now the future of ham radio.

Hopefully it won't include too many hams of your ilk.

I believe that is a crystal controlled unit and if so all you need is the crystals, a schematic or knowledge of how it is wired and to dig in and add additional crystals.
However, I have never owned one so I could be way off base.

Uhhhhh, I think no-Code amateur radio in the USA was instituted by
the Reagan/Bush administrations.

1585. Dead End on the Cam89

Newsgroup: rec.radio.cb
Date: 2000-01-11 00:00:00 UTC
From: The Partins <japartin@corridor.net>
Message-ID: <s7mmqugqoj8102@corp.supernews.com>
Source record: 19434

Hi Everyone,

Thought I would give it one more shot, but I believe I've just about run out of options for my limited expertise and will probably have to go to a tech, who will have the equipment, schematic, and expertise to "trace" (I've heard techs talk about this) the errant signal causing the hum/buzz during transmit.

Thanks to all who gave suggestions and showed interest.

The latest suggestion I've had was to connect a good, known power supply to the 12V mobile connection, bypassing the internal power supply...did this, but no change. The problem still occurs, thus the internal power supply is not the problem, but as mentioned earlier by Dave Hall, the radio is 20+ years old and may have other caps in serious trouble.

Anyway, I thought I would "fish" for any new ideas one last time, before I turn it back over to my brother and tell him it's time for a real tech to take over!

The following (between the lines of asterisks) is a copy of the original post:

****
Hi, and Happy New Year,

My brother recently purchased (via Yahoo) an old Cam89 which has the singular problem of a hum or buzz during transmit. I have been unable to figure a cure and was hoping a CB guru might point out a simple solution. Consider the following: 1)the radio hums only during transmit; it receives fine without any hum, 2)when transmitting, it kicks a carrier, and even modulates, but everything competes with the loud hum, 3) am using a good, known mic, so the mic's not the problem, 4) the radio appears clean with no signs of modification, 5) this is a pre-PLL design with 12 crystals for synthesis, 6)have checked the mic socket on the radio,tested fine, went ahead and re-soldered since the connection looked somewhat poor, 7) temporarily "piggybacked" a large electrolytic onto the main cap in the power supply, didn't help, 8) have checked for loose connections/poor grounding, have found none.

Everything else about the radio works fine. Hope there's something simple I'm missing.

TIA,
Nolan

Does anybody know if this is a good CB and how it compares to others out there in the same price range?

I am also looking for some input on the Cobra 29LTD ST.

Which would you recommend buying the Midland or the Cobra?

Thank you in advance.

Don't let this guy get to you! He is obviously one of the guys who doesn't know anything about feedline length and it's effect on SWR.

In case he's reading! In order to assure the best SWR of the feedline/antenna system, the characteristic impedance of the feedline must match precisely the characterisic impedance of the antenna feedpoint at the desired frequency. Sometimes this can only be observed when the feedline is at odd multiples of 1/4 wavelengths (1/4, 3/4, 1-1/4). So cutting the feedline is not so far-fetched if the desire is to improve the SWR.

IMHO

This is pretty well documented and standard in the world of Radio
for optimizing RF Output and insuring cleaner operation.

In order to assure the best SWR of the feedline/antenna system, the
characteristic impedance of the feedline must match precisely the
characterisic impedance of the antenna feedpoint at the desired
frequency. Sometimes this can only be observed when the feedline is at
odd multiples of 1/4 wavelengths (1/4, 3/4,
1-1/4). So cutting the feedline is not so far-fetched if the desire is
to improve the SWR.

I have optimized many antenna systems using this method. In fact, it is
very common when working with antenna arrays, like twin firestiks on
trucks.

BTW: When I say cutting, I mean cutting to keep the length to odd
multiples of 1/4 wavelengths, not small increments.

I'm in total agreement!

Dunno, Jim, will you? My statement means that pre-April 15
extras will be forced to present their licenses to prove
that they are not 5wpm extras. Advanced hams will have
no such problem. :-)

This has got to be the most useful post I have seen on this newsgroup. As a CBer, Ham, MARS operator, etc., I find it refreshing not to be scorned for the type of radio I like to operate.

Kudos to You, Yrac!

In article <20000102150845.01942.00000722@ng-fr1.aol.com>, yrac@aol.com (Yrac) wrote:

You must be new to ham radio. MY extra ticket required 20 wpm, not 13. (I
took the test in a real FCC office in Buffalo, NY in 1984.)

Subject: Becoming A Real Man/Husband
Importance: High

THE TWO YEAR DEGREE

A new two-year degree is being offered at the University of Michigan that
many of you should be interested in:

Becoming A Real Man/Husband.
That's right, in just six trimesters, you, too, can be a real man - as well
as earn an AA degree (AA Real Men).

Please take a moment to look over the program0 outline.

FIRST YEAR

Fall Schedule:
MEN 101 Combating Stupidity
MEN 102 You, Too, Can Do Housework
MEN 103 PMS-Learn When to Keep Your Mouth Shut
MEN 104 We Do Not Want Sleazy Under things for Christmas
(at least not as a primary gift, they make OK stocking stuffers)
Spring Schedule:
MEN 110 Wonderful Laundry Techniques
MEN 111 Understanding the Female Response to Getting in at 4am
MEN 112 Parenting: It Doesn't End with Conception
EAT 100 Get a Life, Learn to Cook
EAT 101 Get a Life, Learn to Cook II
ECO 001A What's Hers is Hers

Summer Schedule:
MEN 120 How NOT to Act Like an Idiot When You're Wrong
MEN 121 Understanding Your Incompetence
MEN 122 YOU, the Weaker Sex
MEN 123 Reasons to Give Flowers
ECO 001C What Was Yours is Hers

SECOND YEAR

Fall Schedule:
SEX 101 You CAN Fall Asleep without It
SEX 102 Morning Dilemma: If It's Awake, Take a Shower
SEX 103 How to Stay Awake After Sex
MEN 201 How to Put the Toilet Seat Down
Elective (See Electives Below)

Spring Schedule:
MEN 210 The Remote Control: Overcoming Your Dependency
MEN 211 How to Not Act Younger than Your Children
MEN 212 You, Too, Can Be a Designated Driver
MEN 213 Honest, You Don't Look Like Tom Cruise
MEN 230A Her Birthdays and Anniversaries Are Important

Summer Schedule:
MEN 220 Omitting %&*! from Your Vocabulary (Pass/Fail Only)
MEN 221 Fluffing the Blanket After Farting Is Not Necessary
MEN 222 Real Men Ask for Directions
MEN 223 Thirty Minutes of Begging is NOT Considered Foreplay
MEN 230B Her Birthdays and Anniversaries Are Important II

COURSE ELECTIVES:
EAT 101 Cooking with Tofu
EAT 102 Utilization of Eating Utensils
EAT 103 Burping and Belching Discretely
MEN 231 Mothers-in-Law
MEN 232 Appear to Be Listening
MEN 233 Just Say "Yes, Dear"
ECO 001C Cheaper to Keep Her

The most unfair thing about life is the way it ends. I mean, life is tough. It takes up a lot of your time. What do you get at the end of it? A death! What's that, a bonus? The life cycle is all backwards.
You should die first, get it out of the way. Then you live in an old age home. You get kicked out when you are too young. You get a gold watch, you go to work. You work forty years until you're young enough to enjoy your retirement.
You do drugs, alcohol, you party, you get ready for high school, you become a kid, you play, you have no responsibilities, you become a little baby, you go back into the womb, you spend your last nine months floating, then you finish off as an orgasm.

The poster is referring to after April 15 when all classes will only
require 5 wpm. There will no longer be any advanced class license
issued, but those who currently hold an advanced class, can continue to
hold that license indefinitely.

Thanks man, I just remember when I first got a computer. All I wanted to do was check out other peoples mobile installs for their Keydown, CB radio equipment etc.etc. I found a few pages, Big Radios, Dave Made, Train There is others too. But I just thought about how much I wanted to see this kind of page Back then, and figured, since me and all my Tag Team Partners have got some sharp looking installs, with extra alternators and so forth that we might as well make a page and share it with everyone else. When people reply like you did it makes it all worth it. I appreciate the compliment. Catch ya later.....

From: Kevin Wentland <alamocity99@hotmail.com>
Message-ID: <85g3vhkot1@leo.brooks.af.mil>
Source record: 19473

I have been searching all over the net to try and find the answers to my questions and I have yet to find any.

When an antenna says that it can handle up to 3000 watts what does that mean?

What is the difference between one that can handle 3000 and one that can hande 500?

If I am going to run just a stock rig with no mods what type of antenna do I need?

I drive a Ford Ranger, I see most people mount their antennas on the rail of their truck bed, how does this compare to mounting it on the roof?

>wrong!
>
This was very well put. I explain this to most when tuning an antenna on a
truck and the best achieved on it is 1.5 on one and fourty. Sometimes the
vehicle will dictate the best swr. Sometimes it won't be good. Use the
manufactures recommended length of coax. The better it is shielded the better
it will perform. Make sure it will handle the Power you may what to throw
through it.

Good Luck

Source record: 19475

The Cobra 29 is a much better radio with all the bells and whistles. The only done side is its size. The Midland 77-115 is a throw away AM rig. It doesn't even have a noise blanker. If you want a small sized radio with weather and a lot of nice features look at the Midland 79-290 AM/SSB. It has weather and can be modified for 240 channels plus the 10 meter band.

1627. Re: FS: SP63 Antenna "Like Penatrator"

Arent you worried about them taking away the CW portion of the bands ? I am sure
it
will happen some day. It looks like the first steps have been taken to do this.
They might
still keep voice on the upper portion of the bands, but soon you will hear PSK31
and RTTY
on 14.010

Hey, why don't they get rid of RTTY too ? That is pretty obsolete.

Pretty obvious, Jim, Advanced class licensees don't lie. :-)
Why should they? Nothing to be gained by lying.

Yes, but nobody will believe you after April 15 unless you present
you license. After you renew, nobody will believe you unless you
present your *old* license. OTOH, nobody has any reason to doubt that
I have an Advanced license. BTW, I've been licensed since 1951, 33
years prior to 1984, and am a member of the Old, Old Timers Club.

I have an RCI-2950 for sale, about 1 year old. Freq mod (26.0-29.6) only.
Has been mobile since purchased, so it has a few small scratches on the top,
otherwise looks fine, guaranteed to work when shipped. Comes with bracket,
manual, and box.

$250 obo - C.O.D. only.
Partical trade for DirectTV or Dish Network systems and $$$ considered..

Chuck

Has original manual, box, mic, optional CW filters installed, fan option kit
and more.
Covers all HF, Warc and 11 meter (CB) bands.

Check it out. No Reserve!
Good solid rig.
HF Rigs are hot now that everyone will be upgrading with only 5wpm!!!
Thanks,
Mark

The legal power limit is 12 watts so why waste your money on a 3,000 watt antenna? Antenna manufacturer claims are very decieving(nice way to put it).I don't like the way the truck bed works,to much body parallel to the ant.A hood lip mount is nice,a roof mount is a little better.I recommend a 102" whip on the rear bumper,this full size 1/4 wave won't show the effects of the low mounting point.

Well prozac may be spoiled but, he aint doing to bad if he is living at home
and making $56,000 a year. Shit I wish I made that much before I moved out
of my parent's house when I was 18.
It makes sense, the guy has absolutely no bills.
Mom and Dad pay for most everything since he is at home. He will have to pay
for the occasional pizza.
That means he has $56K to just PLAY WITH. That is why this kid has all this
equipment in such a short period of time.

1656. Re: Amateur Restructuring Announcement - FCC screws Ham Radio!

Newsgroup: rec.radio.cb
Date: 2000-01-11 00:00:00 UTC
From: WILLIAM GALLAGHER <ks3y@prodigy.net>
Message-ID: <85glkv$2j1m$1@newssvr03-int.news.prodigy.com>
Source record: 19505
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.cb,rec.radio.scanner,rec.radio.shortwave

Many people seem to think that 5wpm code will be the death of Amateur Radio. Seems to me that most folks who wanted in without code have done it already, and it hasn't trashed VHF and UHF too terribly. There will be a great rush to upgrade, but many of these folks have HF priveleges already.

Has my (*pre-VEC*) Extra been cheapened? No. Has your (*post-VEC*) Extra been cheapened? No. You've earned your priveleges. I've earned mine. I use the pre-and-post VEC to demonstrate that the last time that 'the FCC screwed Ham Radio' the hobby survived...and some may say prospered.

I won't talk about the "Incentive Licensing" fiasco. That really did screw Amateur Radio. You went to bed one night, and woke up the next day with 50% of your HF priveleges gone! We haven't lost anything here!

The only reason that the code exams exist at all is the (old) notion that we as hams needed to be able to intercommunicate with, and/or prevent interference to commercial stations.

Having been a budding commercial (shore station) Morse op in my younger days (read late 1970's), I got to take a wonderful FCC exam. 25wpm mixed groups, 5 minutes, perfect copy. No exceptions. No fill-in-the-blanks. No multiple guess. Just an RE with a tape reader(remember those ?). Then, I got to send. Same 25 wpm, no mistakes...he gave me a page from the Wall Street journal. I don't ever think I've seen so many numbers at one time!

Does this make me a 'better' ham? I doubt it!

The theory was ALL tubes. Heaven forfend that the lowly transistor ever be used onboard ship! (Realistically...the static charges around a ship at sea are incredible, and many PA's are still tube-type, satellite or not).

Does this make me a better ham? Hell no!

The purpose of the technical exams is to prevent us from electrocuting ourselves and our neighbors.

The purpose of the rules and regs exam is to prevent us from trashing the commercial and military frequencies.

Should the exams be 'toughened'? Yes, a little bit. We should be able to demonstrate enough knowledge to prove that we can operate a station without trashing each other. There should be some basics of the more esoteric modes of communications. This will now include CW, for better or worse.

Should the questions and answers be published? Emphatically, NO!

If the questions are published, the 'multiple choice' answers, and the detractors, should not be. This is not to act as a 'filter' to keep people out...quite the contrary...we need many more people populating 'our' bands. The theory doesn't have to be difficult, but it should PROVE that an individual can safely operate a station...and not PROVE that a person can memorize 'trivia'.

How many 'old timers' (yeah...right) 'BASH'ed' their way in?

For those of you who don't recognized the reference...Dick Bash published books in the early 80's that had the questions from the FCC exams. He depended on hams who took the tests to 'smuggle' the questions and answers out to him (not physically, but from memory). So don't let anyone tell you that it was never that way in the 'old days'!

It is up to us to determine how exams are arranged, through the VEC system.

It is up to us to welcome and teach the newcomers. It's a hobby, fer chrissake!

Ars longa, vitae brevis! (the Art is long, and life short!)

73 and keep those flames and letters coming!

Bill WA3RA (ex KS3Y)

BTW...about 50% of my operating is high-speed CW. QRM? What QRM?

>and RTTY
>on 14.010

Well, of course PSK31 and RTTY could operate on 14.010 MHz *now*. The
only CW exclusive band segments now are 50.0-50.1 and 144.0-144.1 MHz.
That's been so for decades. The other set aside areas are only due to gentlemen's
agreements among amateurs. That's worked pretty well for decades, even back
when everyone on HF was a General and there were no artificial class distinctions.
If the anger level doesn't get fanned too high over restructuring, it can continue to
work well.

If CW usage declines sharply in the future, there are likely to be some
adjustments to the gentlemen's agreements dividing up the data portions
of our bands. It happened during the switch from AM to SSB. (SSB started
at the top of the voice segments and gradually worked downward as the
number of AM stations declined.) Something similar may happen with
CW, but the bottoms of the bands should remain a CW refuge for a long
time yet. There are too many existing incumbents for change to be very
rapid.

>Hey, why don't they get rid of RTTY too ? That is pretty obsolete.

RTTY is nearly as old as CW, but it shares an attribute with CW
in that it requires a very simple transmitter to send it (only a couple
of components different from a CW transmitter). So it is likely to retain
a following among amateurs who like to build simple transmitters.

Being FSK, it also has a SNR advantage over OOK (6 dB better at
the same baud using a soft demodulator/slicer). Of course RTTY
normally is used at a higher baud than most CW operation, so this
advantage is mostly just theoretical in current amateur practice
until the CW rates get up to 40-50 WPM. Then RTTY does start
to show its advantage.

RTTY encoding and decoding are also easily mechanized, so the
tedium of Morse wetware conditioning is eliminated for users of
this mode. That's bound to impact its popularity in coming years
with the relaxation of government mandated wetware conditioning

requirements.

But with VLSI DSP now cheap, the meaning of simple is changing a bit. I/Q modulators and demodulators can now have a very low parts count. This trend will only accelerate. So designs we might now consider complex will come to be considered simple as we move from designing with individual transistors to using VLSI modular blocks as our components. Thus it is likely that some of the better digital modulations, with their associated coding gains, will gain greater popularity even among those who wish to build "simple" equipment.

In any event, major changes won't occur overnight. It took over a decade for SSB to supplant AM, and there is still some activity by some amateurs running AM today, four decades later. It will likely take a decade or more for any major decline is CW activity to become apparent. Even in 2050 there will likely still be someone using it on the ham bands, for nostalgia's sake if for no other reason. Heck, we still occasionally hear stations using American Morse on the bands, and that's been obsolete in radio for nearly a century.

What was the argument? Could you explain that one? It was more like
your attempt to dictate to me how you think I should think. BUT, I also
know that you will never change my mind and I wouldn't waste time trying
to change yours. I would, however, remind you that the callsign is
W5TIT, and not whatever rendition you make of it. Your dirtiness, not
mine.

We now have the Galaxy books in stock. These cover the EPT3600 and EPT6900 chassis types. Complete details on this specific book are on our Web site at:

www.cbcintl.com/Galaxy.htm

Now, we offer an even better mail order service and you can see all our CB modification kits, plus other FREE information at our web site:

www.cbcintl.com

Besides browsing the site, you can still download either the complete CB catalog, or just the Order Form from the home page. We've also got a new Email Order Form (for VISA/MC) if you're in a hurry.

The full catalog is in .PDF format. There are several file choices if you just need the Order Form. We've also included full schematics on all our kits, and some other goodies.

* *
In case you didnt' already now...

Who are we? Since 1976 we've been the leading supplier of books, plans, and kits just for CB radio. Do-it-yourself repairs and modifications, 10-Meter Ham conversions, amplifiers, FM converters, bleedover filters, adding new frequencies, etc. Secrets of how to increase your power, range, and privacy.

If you have any problems getting the files, or need additional details on what we offer, please email us directly at:

77We're selling our 3 most popular CB books as a special combo on EBAY. Here's your chance to save up to HALF the $80 list price. The books included are:

BOOK #1: THE "SCREWDRIVER EXPERT'S" GUIDE To Peaking Out & Repairing CB Radios by Lou Franklin. List $22. The most popular "big dummy's" guide ever published on do-it-yourself CB repairs & modifications. Covers peaking of receivers, transmitters, modulation, mike problems, antenna & SWR problems, detailed frequency modifications for both crystal & PLL radios. Loaded with charts, illustrations, and specific instructions for most brands including the new export models. This latest edition also covers slider and broadbanding tricks, FM conversions, and much more!

BOOK #2: THE CB PLL DATA BOOK by Lou Franklin. List $20. The only complete reference source on CB PLL synthesizer circuits ever published! Detailed PLL theory explained in layman's terms. How they work, and how to modify them for many more channels. Includes specific PLL block mixing diagrams, truth charts, & IC pin function diagrams for nearly every PLL chip ever used. Covers all the most popular U.S. & export chassis, with specific listings of all models using the chip.

BOOK #3: UNDERSTANDING & REPAIRING CB RADIOS by Lou Franklin. List $38. Giant 370-page technical book for the professional repairman. Picks up where the "SCREWDRIVER EXPERT'S" GUIDE leaves off. Includes circuit descriptions & troubleshooting guide for 23- & 40-Ch., crystal & PLL, solid-state & tube, AM, FM, SSB, CW, American & export models. Covers test equipment (& where to find it), transistor basics, synthesizers, receivers, transmitters, power supplies, T/R switching, antennas, interference, parts & accessory sources. Over 350 illustrations including schematics, charts, and photos. Huge subject index also lets you look up repairs by symptoms. This is "must" reading for any serious CB technician!

You can see exactly what these books look like, plus all the specific, chapter-by-chapter details at our Web site:
www.cbcintl.com

Or go directly to the EBAY sale location at:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=234395154

First. Jealous of what? $56,000, Im sure. If I lived with my
parents and made $56,000 dollars I would have a MUCH better car than
you do. I would own my own house. I would have a T1 instead of a
riply cable modem, actually no, I suppose cable is good enough,
depends upon what you do. Where is the proof my friend? Anyone can
talk the talk. Is this why you have to sell your 16 pill? Is that
why you are trying to sell it cheap? You contridict yourself left and
right. Surely on a $56,000/year salary you must work for a half
reputable company. So I suppose then you are certain what a CSU/DSU,
Frame Relay, etc, etc is correct? Not to mention how they function.
I assume you then now how to figure how many clients are within a
specified subnet mask? I could certainly go on and on.

Also, I believe this to be the second time someone has commented about
your picture and you simply replied with "so you think Im cute" or
something homosexually related.... what gives with that Prozac?

You are a worthless nothing. A pest that needs squashed. Now run
along. I certainly dont wish to start bragging now, I may make you
look more poor than a street drunk. Oh, if I did, I have the
"pudding" right here fag!

Every reference of yours is homosexually related. Whats with the
pudding jack ass? You have a fascination about pudding?

Bitch Bitch Bitch! Where were all you cry babies when the ARRL asked for petitions regarding the restructuring plan? Just how many expressed their feeling to the FCC? before the announcement! IMHO the ones that cry and whine the most did the LEAST to express how they feel about code or no-code where it would of mattered. It's to late so it's better to accept the changes and support the man and woman in this hobby of ours to upgrade. The actions and support that is shown today will greatly effect amateur radio in the future. And thats my 2cents worth.

I myself do not view this as dirty, just kind of silly , not as silly as this thread continuing on and on though,I also look to the re structuring of ham radio as a beginning , not and end , you know the old is the glass half empty or half full type of reasoning ,

I have had two of the amps. 2-3 W max dead key. Swing with modulation should not exceed 6-8W. You will be at modulation compression if you try anything more. I have seen 270W -300W output on this amp but 270 is about all you will get without compression. It is a good amp; the receive pre-amp and SSB delay work fine. Don't use the green button unless you are overdriving it.

John, before you go slashing your coax, check that your mount is a good electrical ground. I've used some trunk-lip mounts that needed a little help to ground to the lid properly. Also, you may want to keep in mind that any VSWR better than 2:1 is acceptable.

A 1.7 SWR means that input impedance to the antenna is about 30 ohms. actually this is about right for a loaded antenna like the firestick. a fuul lenghth 1/4wl antenna runs between 40 and 45 ohms and a loaded antenna is even less. Where is it mounted? If it is mounted on the rear deck up close to the back window tends to lower the feedpoint impedance giving a hgiher SWR while mounting it further back will tend to raise the impedance for a better match to 50. This is due to changes in antenna to groundplane capacitance. Moving the antenna may also require retuning it slightly.

Ron,

I am not a HAM yet, so I guess you can take this with a grain of salt (I'm sure SOMEone will have something to say...)
Anyway, I am studying for the Tech-Plus code, yes... Plus....
Do I think I will use CW? I honestly don't know, but I am curious about it and would love to learn it, just because it is one more means of communications. As others have written, it uses less bandwidth and with conditions being the way they are... you never know when that might be the ONLY way to communicate.

Is it out of date? Maybe. Is is necessary? Probably not. Is it good to know just in case? I think so.

Maybe learning code should be thought of like boot camp; it test you and give you training for something you may never need but will sure be glad you got if you do.

IMHO

Lee

After a long night on-line discussing begging strategies most likely to win
table scraps, tips on actually *catching* that damn squirrel next time,
sending jpegs of each other's rear ends, and shamelessly flirting with the
other doggies (all claiming to be 2 years younger and 20 pounds lighter than
actual), my dog just hasn't the time left to study Morse code. I think
she's still smug about the fact that she spells better than I do. And
typing on
a standard keyboard with such big mitts is no small feat. ;)

Perhaps they could wave the code requirement for dogs.
But then, how would they communicate over the air?
Special "barking only" repeaters?

She just typed "RTTY! RTTY! RTTY!" on the next computer.
What's that?
:-)

A wonderfully well-thought out and reasonable response.
Thank you! I share your optimism that things will work out
all right.

I also agree with a number of points AB7RS made, especially
about the tests being too easy. As I read it, it will now be up to
the amateur community to determine the contents of the
question pools, and we should really concentrate on making
sure that the questions chosen represent a proper cross-section
of knowledge at an appropriate level of difficulty. And certainly vigilance
against dishonest VEs is a good idea.

Perhaps ARRL could take up the slack in high-speed Morse
and have special awards for (say) 100 QSOs at (13, 15, 20,
whatever WPM). That would have to be worth just as much
as an FCC document, and probably would look better on
the wall, too. :)

Are Pirate amps still around? Who sells them? A friend of mine is looking for them and can't seem to get ahold of one locally. Do they have a homepage? Any and all suggestions are appreciated.
Please respond to the newsgroup as I *do* intend to keep reading here (I hate it when people request email answers).

Thanks
dirk

Radio shack. You've got questions, we've got cell phones.

Tom W8JI wrote:

>
> You didn't take away anything, but the FCC sure did!

No, they didn't. You earned whatever class license you
hold, and can lay claim to the set of skills you had to demonstrate to the FCC or VE when you were tested, regardless of what the FCC does now. That can never change. For that
matter, a ham license is not intended to be proof of some static set of skills that will forever remain the same. It's a permit to get on the air with specific privileges. The *only* way the FCC can change the value of your license is if they add or delete subbands from your current privileges. You're free to confuse

the effort you put into getting the license with the operating
privileges it grants you, but that's a classic case of mistaking
the map for the territory. So now it's easier for newcomers
to get your class of license, but that doesn't change what you
accomplished to get there.

And if it is so damn important to you
that people on the air know you're an "Original Extra" or whatever, to set you apart from the folks who only had to do 5WPM, fine. You'll sound like an elitist, but go ahead if it
will make you feel better. People will know what you mean
if you say you're an "old extra" or "original extra".

>
> It's typical for those who dislike working for something and who
> expect handouts to not understand why some people have pride in what
> they accomplished.
>

You can be proud of your accomplishments and also
accept without bitterness that the world has changed.
5 WPM does take work and study, and is surely not a "handout".
I know several people in their 20's and 30's struggling
to achieve their 5WPM, who would be very insulted by
your characterization of this as a "handout". Yes, it's easier,
perhaps much easier, but it's a lot more work than most lazy
people would ever put forth. 5 WPM will do a fine job of
keeping people looking for handouts off ham radio.

A lot of times I hear this "handout" crap, and I see a
survivor of a hazing ritual, known as "high speed code", resentful and angry
that others will have an easier time than you had. Hopefully this is not your
real motivation for being
so upset at the changes.

>
> With that in mind, I understand why you agree with the suggestion

Stalking Ghost <pmetcalf@nbase-xyplex.com> wrote:
: This is pretty well documented and standard in the world of Radio
: for optimizing RF Output and insuring cleaner operation.

Only on CB son. The rest of the RF world does not worry about SWR
that much.

: In order to assure the best SWR of the feedline/antenna system, the
: characteristic impedance of the feedline must match precisely the
: characterisic impedance of the antenna feedpoint at the desired
: frequency. Sometimes this can only be observed when the feedline is at
: odd multiples of 1/4 wavelengths (1/4, 3/4,
: 1-1/4). So cutting the feedline is not so far-fetched if the desire is
: to improve the SWR.

You were correct until you got to the last two sentences. Trimming the
coax does NOT change the SWR. That can only be done by changing the
impedance match between the antenna and the coax.

What trimming the coax does is change the input impedance of the coax.
This can (sometimes) be important with a relatively fixed tank circuit
on a CB radio. With most other radios, the tank circuit can be tuned
to match this SWR induced input impedance.

: I have optimized many antenna systems using this method. In fact, it is
: very common when working with antenna arrays, like twin firestiks on
: trucks.

At least, you have fooled yourself into thinking that it did some good.

: BTW: When I say cutting, I mean cutting to keep the length to odd
: multiples of 1/4 wavelengths, not small increments.

Did you put the coax on a TDR (time domain reflectometer), to ensure
that you actually were cutting it to 1/4 wavelength? If not, then
you probably were not doing so - especially if you used the same lengths
for the various versions of 50 ohm coax.

C.H. Parsons <chparsons@uswest.net> wrote:
: I differ in that I do not believe that there is something "wrong" with and
: antenna that can not be tuned to a 1.1:1 VSWR, many antennas are not even
: designed to achieve that. My 102" whip mounted in the center of my old
: beater Radio Car had approximately a 1.2 to 1.3 to 1 and that was considered
: exceptional. The only antenna I have used that, right out of the box, had a
: 1.1:1 was a Starduster base antenna. It is one of the things that really
: impressed me at the time, as my meter and anyone else's that I could talk
: into coming over with theirs moved so little, that we thought something was
: wrong!

I agree 100%. I don't believe that I have ever implied otherwise.

My comments were for an antenna designed to be a match for 50 ohm coax,
or at least close to it.

I have often stated that even a 2:1 VSWR is not really a problem. The
extra loss due to the VSWR is unnoticeable - both on receive and transmit
signal strengths.

1) the wattage rating is simply the maximum amount of watts
the antenna is built to withstand and an general indicator
of the toughness of the antenna.

2) in amy mobile installation the ideal antenna mounting is
the roof for optimum performance and matching. Any where
else is a compromise and some antennas work better than
other for UP bed rail or bumper mounting. SWR matching and
loading is some times harder to achieve.

Sorry, but not true! I have had two of them over the last 7 years. The best
I ever got out with some modulation compression was 300W PEP!

1749. 10 meter or 2 meter, which is best

Newsgroup: rec.radio.cb
Date: 2000-01-12 00:00:00 UTC
From: dongilbert@my-deja.com
Message-ID: <85hvqp$ur4$1@nnrp1.deja.com>

I am wanting to get into amature radio. I have not taken my test yet. There is a local group that communicates on 2 meters. I have heard that it is possible to talk to people throughout the world on 10 meters. in fact, someone in California said he talks to people in the eastern united states all the time. I guess my question is, if one were starting out and only able to buy one radio, which would you start out at? If using a 10 meter, what type of antenna would one need and would it matter if the radio were a base or mobile?

I have done this on CB, HAM, and Military radio. I would agree that the broader banded the operation the less noticable it is.

> impedance match between the antenna and the coax.
>
I have mis-stated myself I'm afraid. I did not mean to imply that very minor trimmings will improve this but instead that true electrical 1/4 wavelengths are the optimum.

> What trimming the coax does is change the input impedance of the coax.
> This can (sometimes) be important with a relatively fixed tank circuit
> on a CB radio. With most other radios, the tank circuit can be tuned

>
> At least, you have fooled yourself into thinking that it did some
good.
>
I am sure from your background that you would agree that antenna arrays

are the most difficult to balance since a minor change over here causes an alternate opposing change over there. I have seen a number of FUBARs created by Trucker's installations causing sporadic lobe generation off of their antenna systems. optimizing the feedline lengths very much reduces this lobe splatter and improves SWR at the same time.

> : BTW: When I say cutting, I mean cutting to keep the length to odd
> : multiples of 1/4 wavelengths, not small increments.
>
> Did you put the coax on a TDR (time domain reflectometer), to ensure
> that you actually were cutting it to 1/4 wavelength? If not, then
> you probably were not doing so - especially if you used the same lengths
> for the various versions of 50 ohm coax.
>
No, instead I connected the coax ONLY, to an impedance bridge and generated a signal on the frequency of interest and optimized the length of the coax for lowest reflected energy at 50 Ohms This generally works out to be an odd multiple of 1/4 wavelengths at that frequency.
I then optimized the antenna in the same way, this time using a pre-calibrated feedline and tweaked the antenna for lowest SWR on the frequency of interest. Once mated the coax and antenna usually require very little adjustment to get a very low SWR. And as you know, on an accurately balanced 50 ohm system the lowest SWR is 98% guaranteed to provide maximum RF output.

Hi Just so you know, if you want a award for code proficiency, The ARRL has offered one for many years. It's called the "code proficiency award. It's starts with the basic award at 10wpm with stickers for speed up to 40wpm. See www.arrl.org for more information.

If you want to do distance, then give 10 a try. I have not had my Radio Shack HTX in my truck for awhile, but I made regular morning QSOs from MA to a kid in Arecibo, Puerto Rico every morning and a guy in El Paso, TX every evening on the way home. Most of the time with only 5 watts. The rig will do 25 watts on high power (more with the mods).

There are quite a few good and CHEAP radios out there.

Hope it helped!

A limited number of callsigns like yours will be available to 5wpm
extras under the vanity callsign program. That may not bother you,
but it bothers a lot of the radical PCTA folk.

I don't know about that! Not to smear your FCC reference, But
a few years ago they arrested a whole group of taxi drivers for
using marine radios just to chit-chat with each other while carting
people around. They each got something like a $50,000 fine and most of
them lost their taxi driver's licenses.

Doesn't seem worth the risk to me!

Go with GMRS and pay for the license! Works just as good!

Or better still, go take the HAM test and get a tech license.
You can work any ham band from 50mhz and up!

if you want to talk to people far away go with ten. if your happy talking to local people on the repeater then 2 meters is the way to go. there are also repeaters on 10 that make it possible to talk back to people out of your local range but that are still fairly close because yall will both have conditions to the same repeaters that are often across the country.

the best sounding hf if you want to talk on 11 meters on am and ssb is a icom
or yaesu with a silver eagle d-104 set up right

1768. Re: 10 meter or 2 meter, which is best

I used a cheap RS mag-mount! Nothing special required!
Just get the SWR as low as possible. I think mine was
about 1.5:1. That was about the best I could get out of the
antenna system without fancy tuning.

BTW: I was using SSB mode! It was the HTX-100 rig!
